Universidade de Sao Caetano do Sul

Instituto Todos pela Saúde

The color behind the figure!

# Why do we need serological studies

- Key questions:
  - how many people were infected
  - may also indicate how many people are protected
- How do you develop and validate a test?
  - Producing the protein: the DNA sequence is enough
  - Defining the cut off and analytical sensitivity: samples from patients
  - Defining sensitivity and specificity

# How we detect antigen and antibody

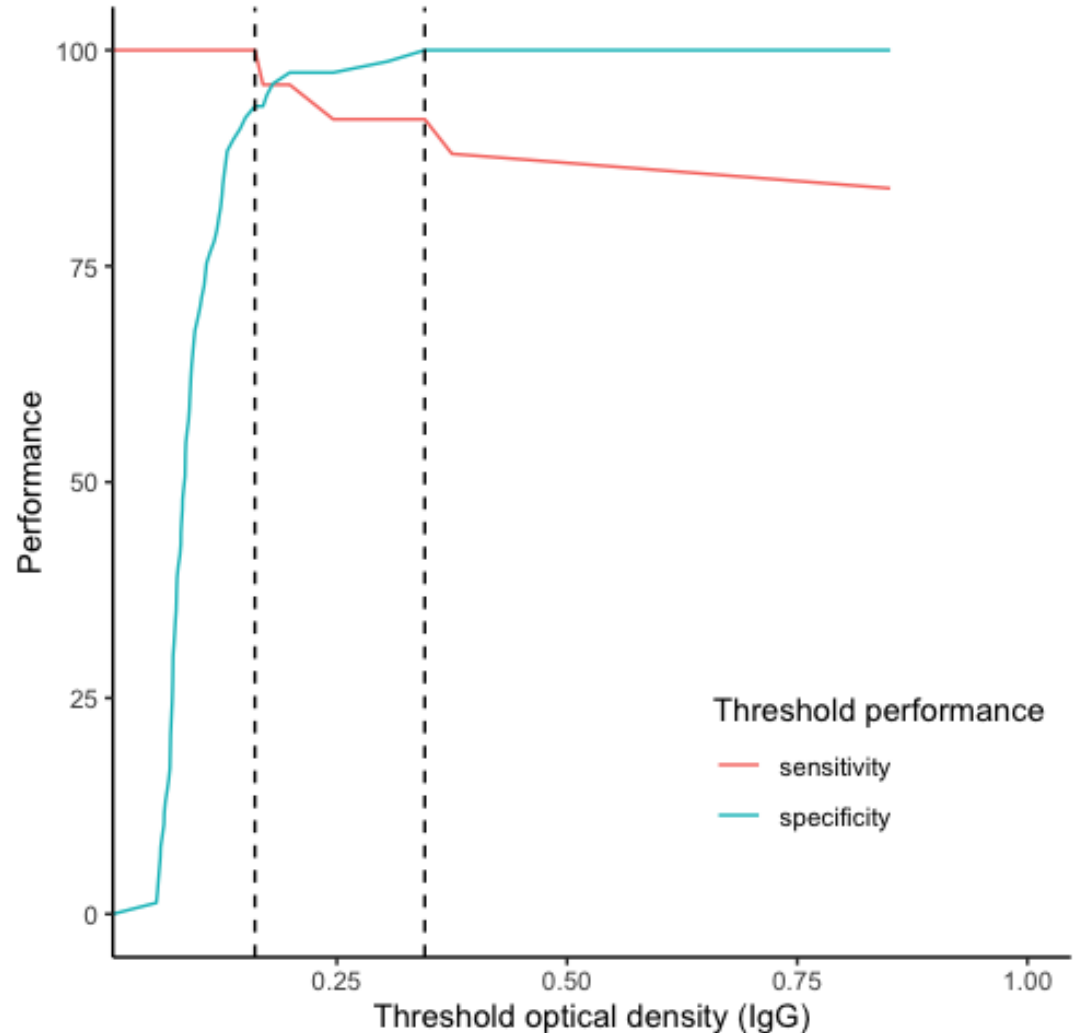

The amount of color = signal

Positive: Signal > cut of value

Reactivity of Advagen IgG assay in cases at different time points after symptom onset and among controls – S/CO calculated using Manufacturer's threshold of 0.306

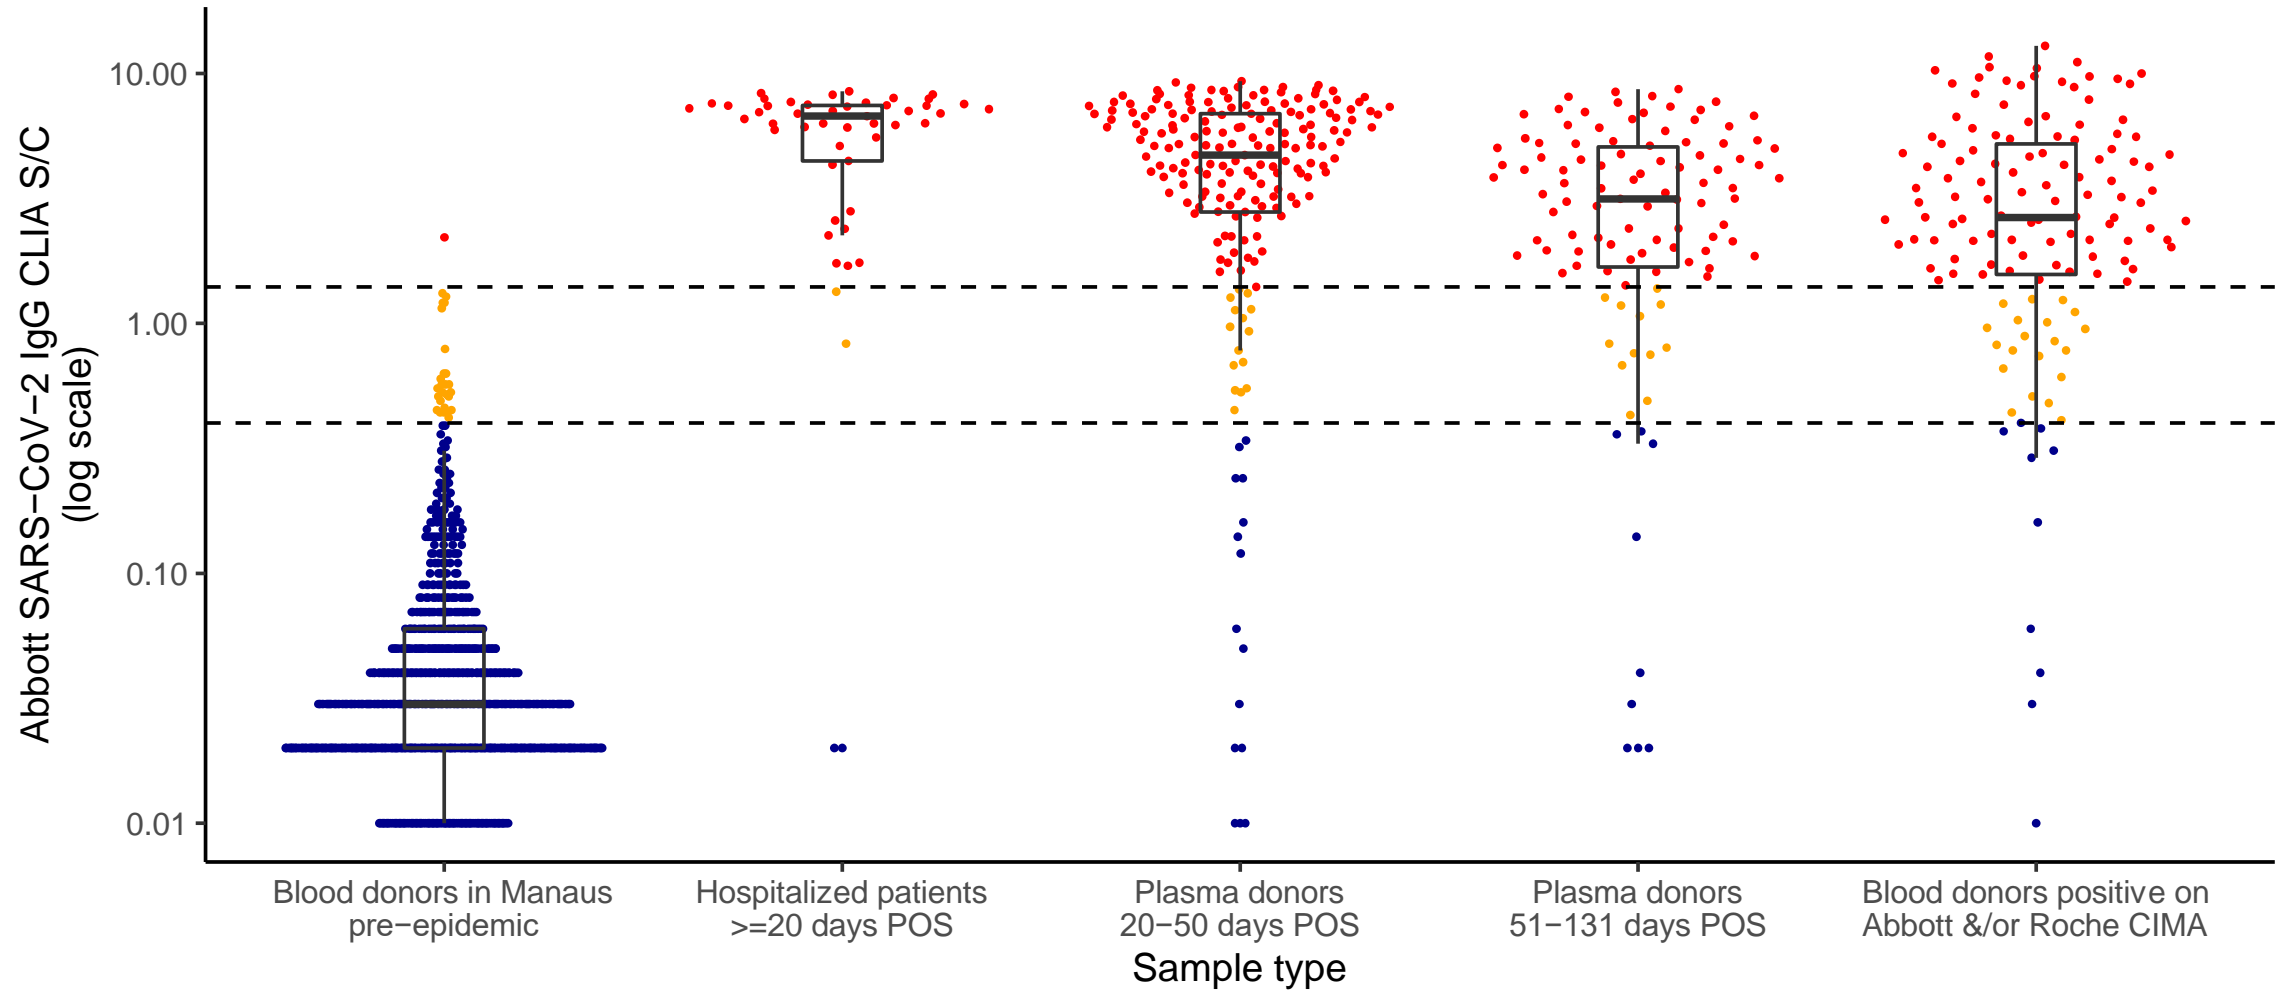

Performance of Advagen IgG assay at different thresholds – comparing cases with serology performed > 10 days from symptom onset against healthy controls

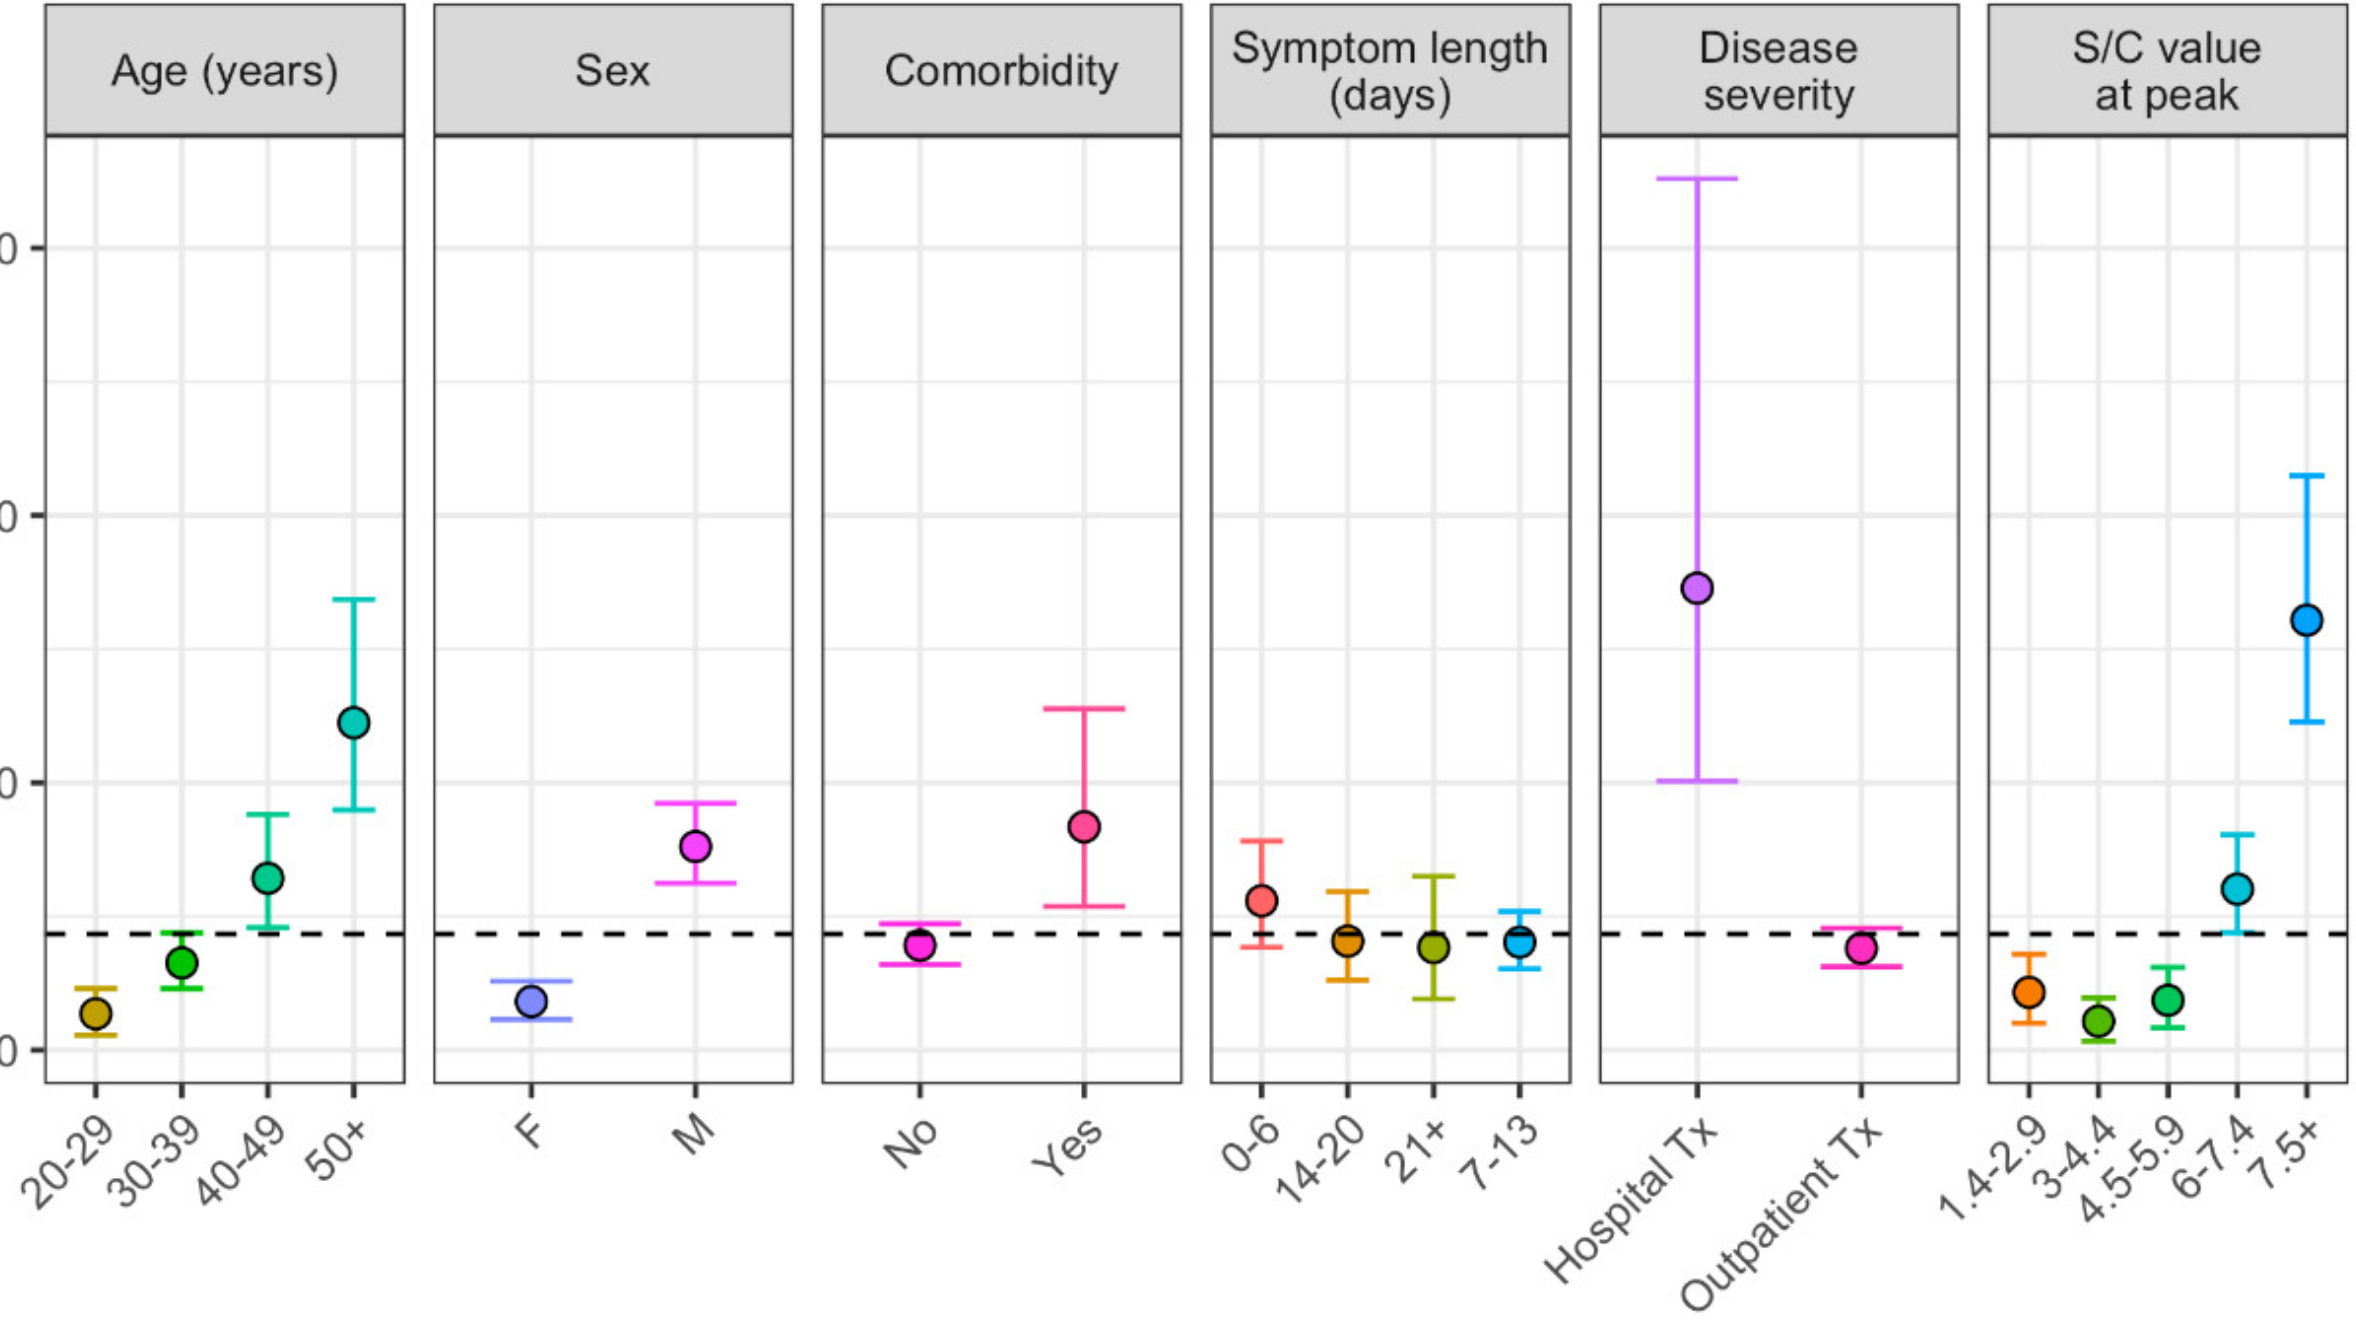

# Methodological questions

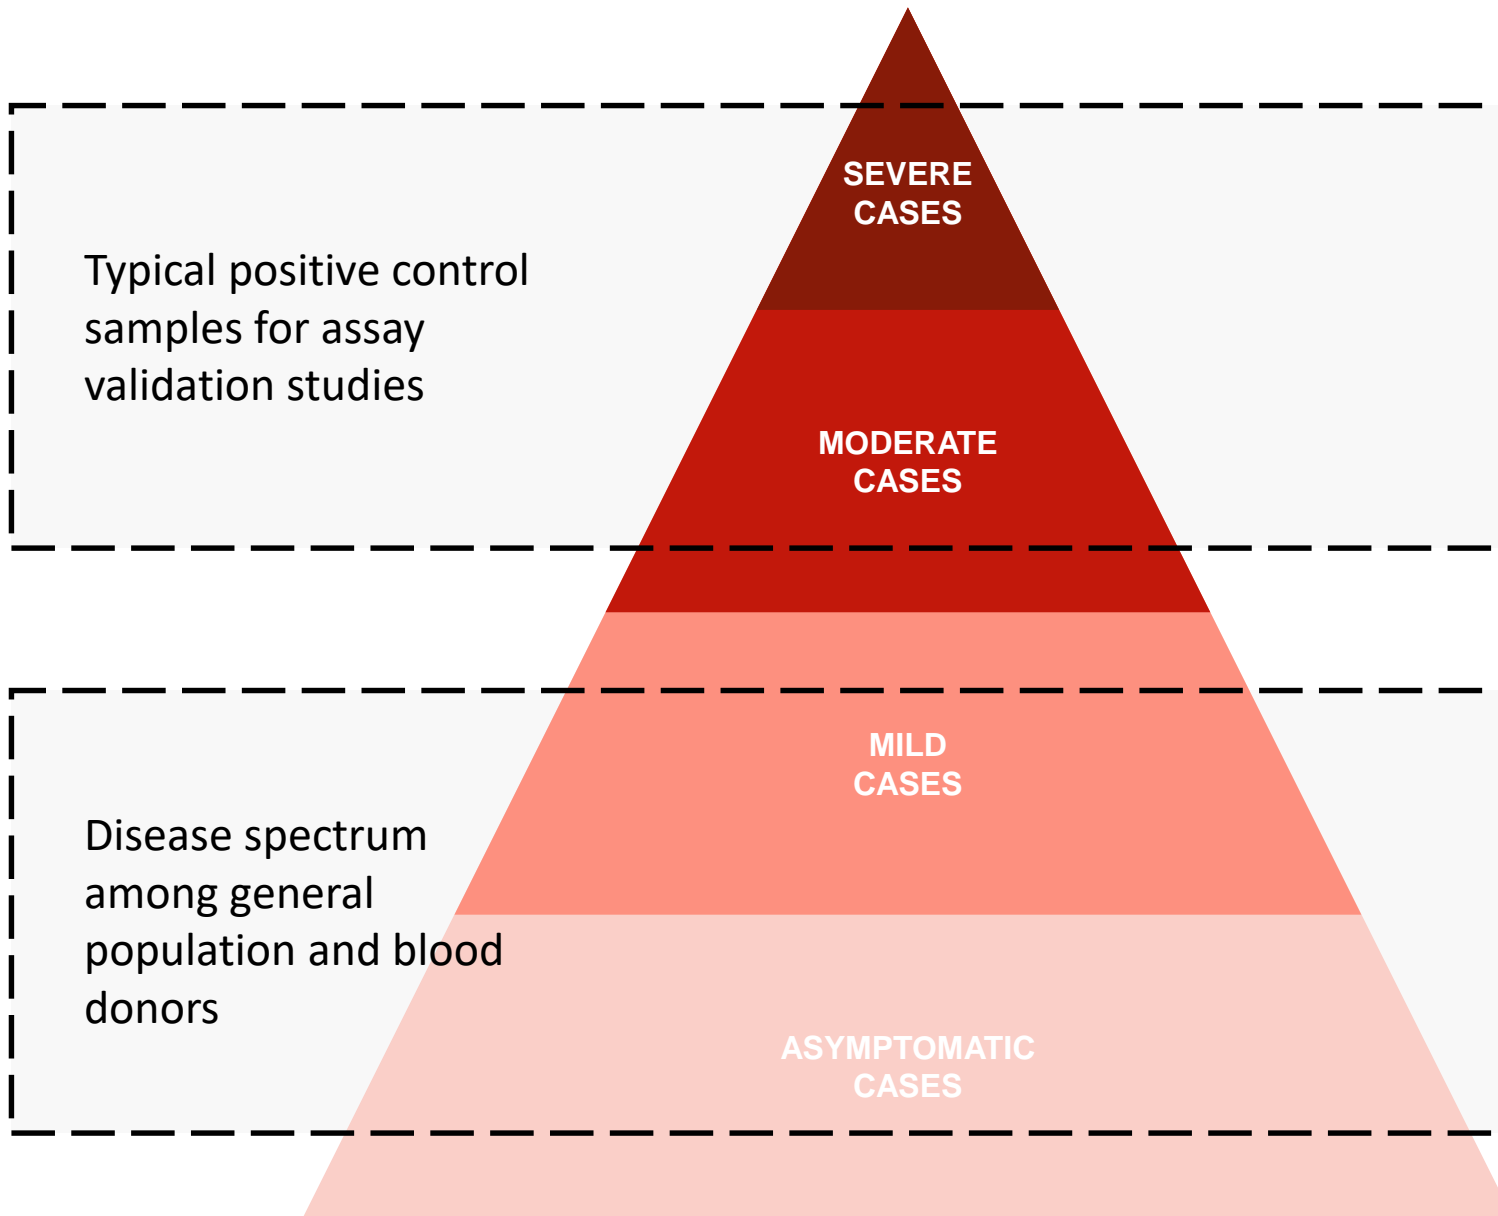

## Serology test characteristics and Abbot anti-N Ab dynamics

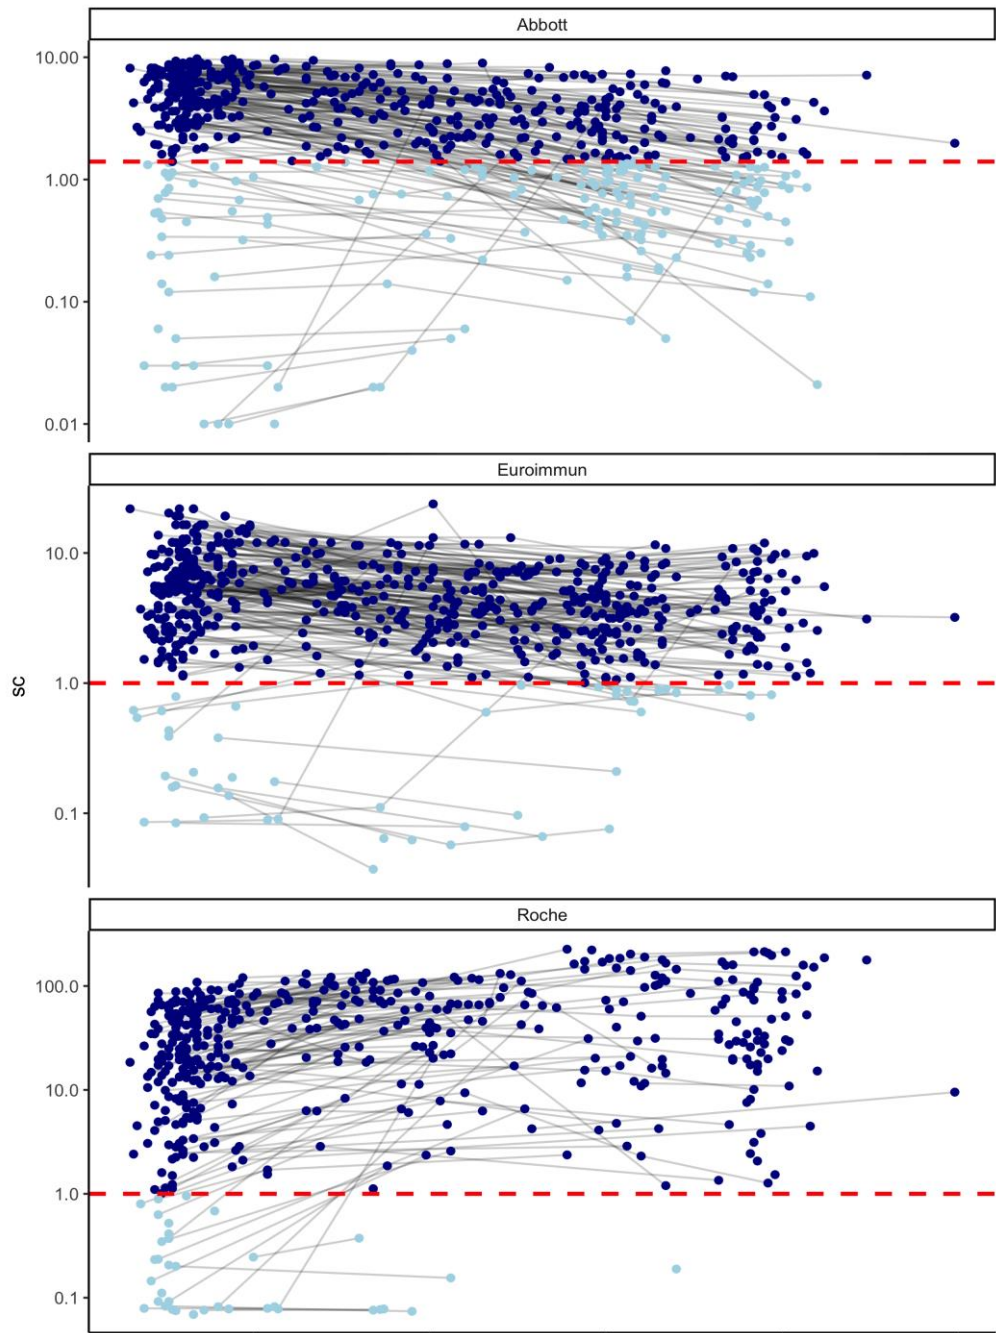

Abbott IgG CIMA S/C half life (days)

Tests had different  
decline rate

# Standardized slopes of bAb signal intensity and nAb titers

Show half lives slide

# Methodological questions

## Blood donors as proxy for population sample

### **Advantages**

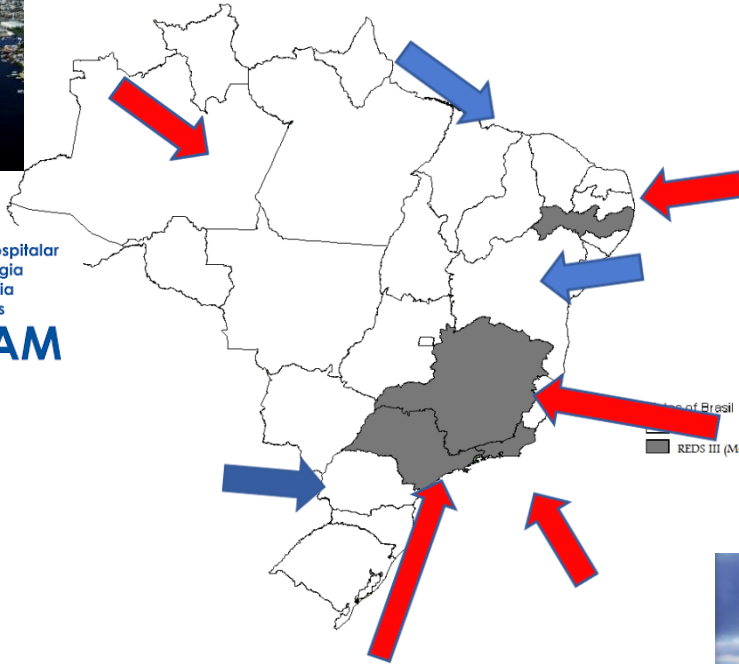

- Fast
- Relatively inexpensive
- Access to state-of-the-art testing infrastructure
- Stored historical samples for 6m in Brazil

### **Disadvantages**

- Selection bias
  - age group
  - socioeconomic
  - spatial distribution
  - deferral criteria
  - behavioral differences

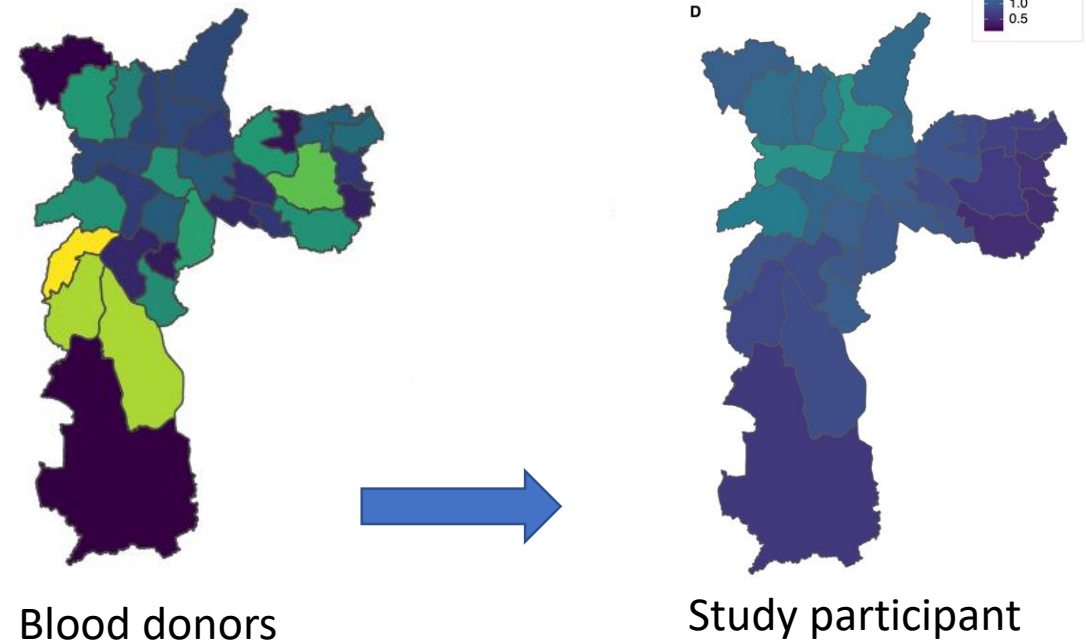

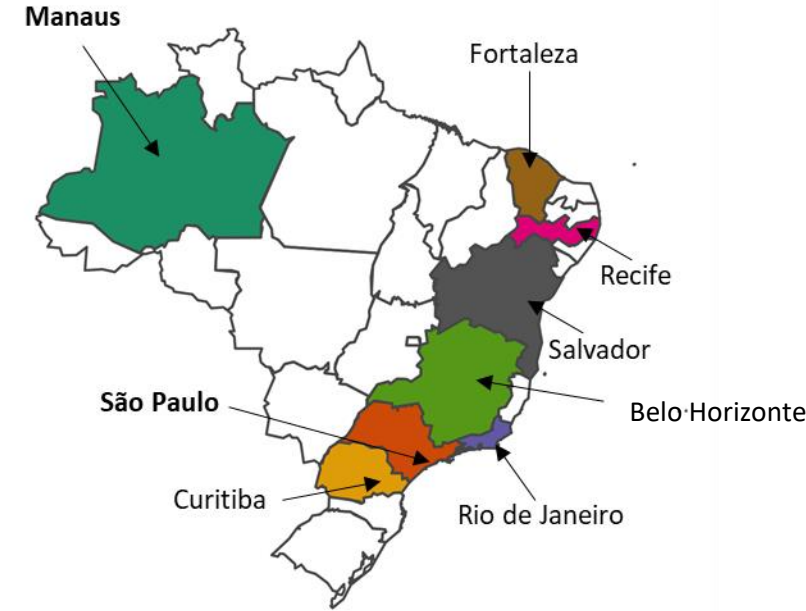

# REDS II- IV program – NHLBI/NIH (2007 – 2025)

Belo Horizonte, Manaus, Recife, Rio de Janeiro, Sao Paulo

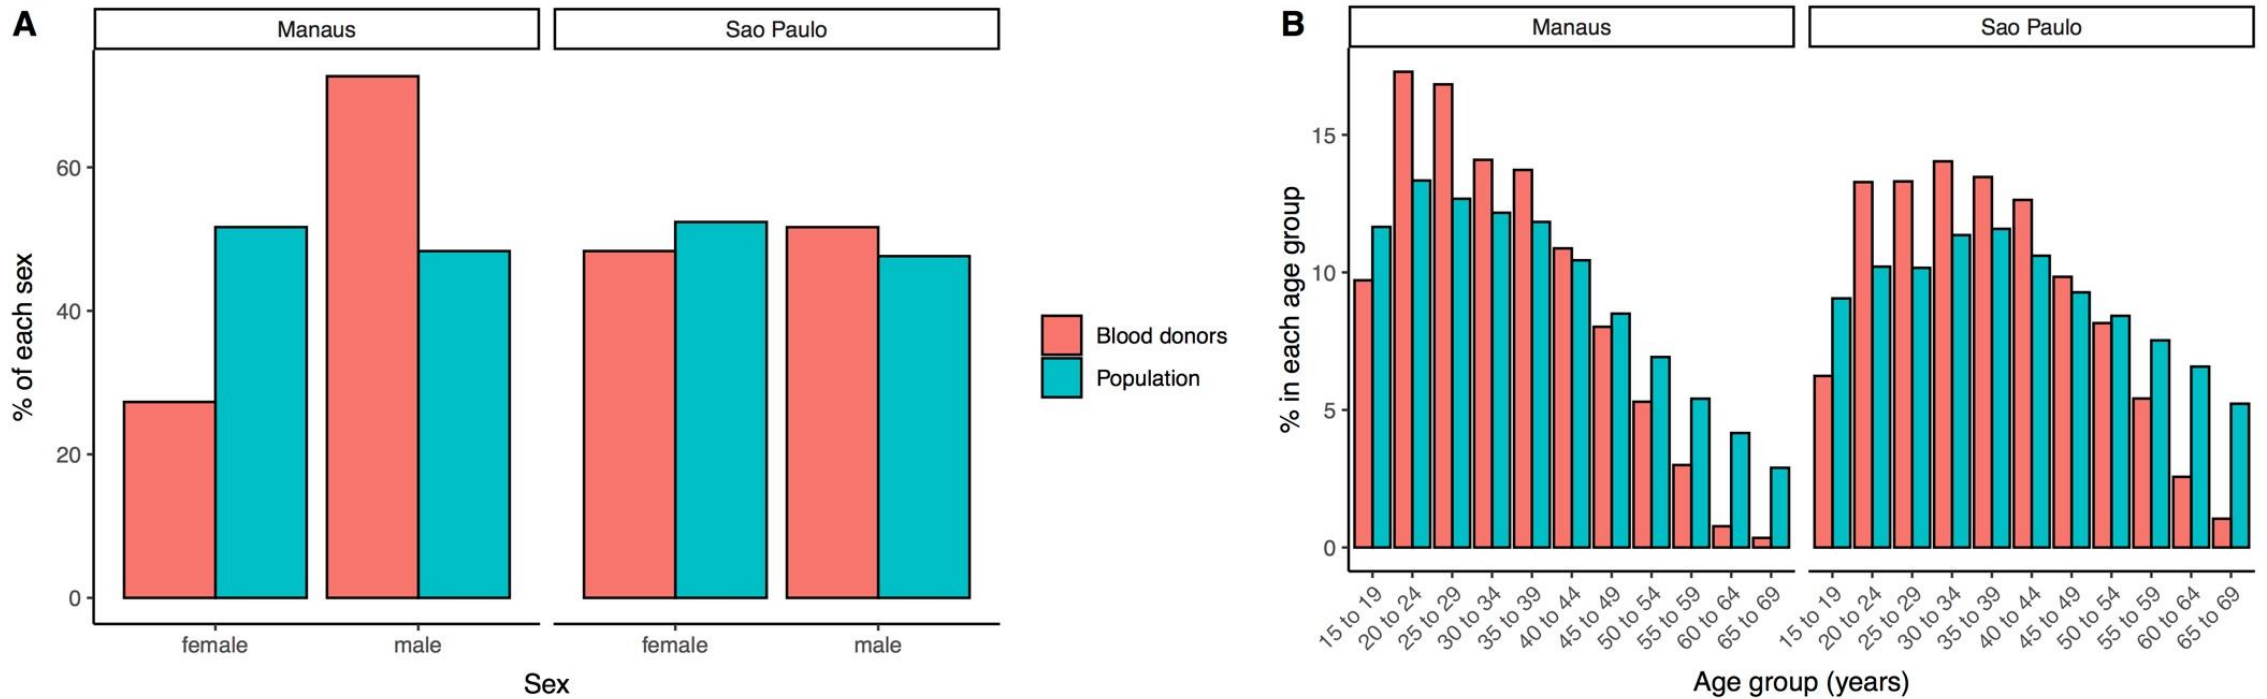

# Blood donor study in Brazil

- Total of 8 capitals (most populated)
  - Retrospectively – Mar-Jul/20 – Abbott anti-N
  - Prospectively Aug /20 – Apr/21 Abbot anti-N
  - Apr-Nov 21 Abbott anti-S (7 cities)
- 
- ~800- 1000 samples per month.
  - Samples were geographically stratified using donor zip code (except Manaus)
  - System to control sample testing

# Methodological questions

## Blood donors as proxy for population sample

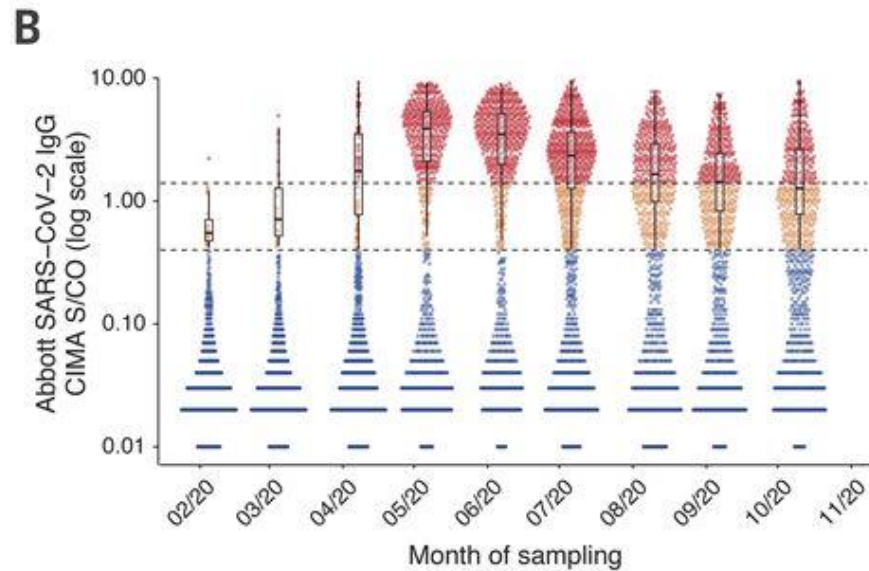

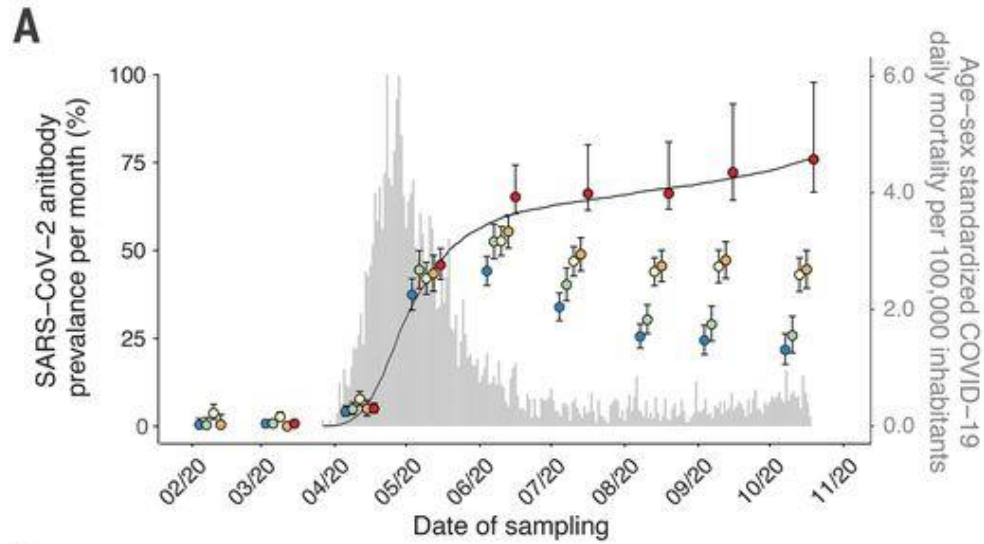

# Are blood donors reactivity different than the general population

Results EIA	Ever donated %		Donated last year %	
SARS-COV-2	YES	NO	YES	NO
Positive	10.7	9.4	9.7	10.8
Negative	88.4	89.3	89.7	88.2
Inconclusive	1.0	1.4	0.6	1.0

# First results from Manaus and Sao Paulo

Adjustment method (S/C threshold):

- Age-sex weighted (1.4)
- Age-sex weighted and sens/spec-adjusted (1.4)
- Age-sex weighted (0.4)
- Age-sex weighted and sens/spec-adjusted (0.4)
- Seroreversion corrected (1.4)

b) Herd immunity threshold in relation to  $R_0$ , comparing SARS CoV-2 with influenza A, Ebola virus disease, poliomyelitis and rubella

BIOTECHNOLOGY

## A city in Brazil where covid-19 ran amok may be a 'sentinel' for the rest of the world

So many people have gotten sick in Manaus that researchers say the virus is running out of people to infect.

By Antonio Regalado

September 22, 2020

In [a report](#) posted to the preprint server medRxiv, a group led by Ester Sabino, of the Institute of Tropical Medicine at the University of São Paulo, says it tested banked blood for antibodies to the virus and estimates that between 44 and 66% of the population of Manaus has been infected since the city detected its first case in March.

“From what we learned this is probably the highest prevalence in the world,” Sabino said in a phone interview. “Deaths have dropped very rapidly, and what we’re saying is that it’s related.”

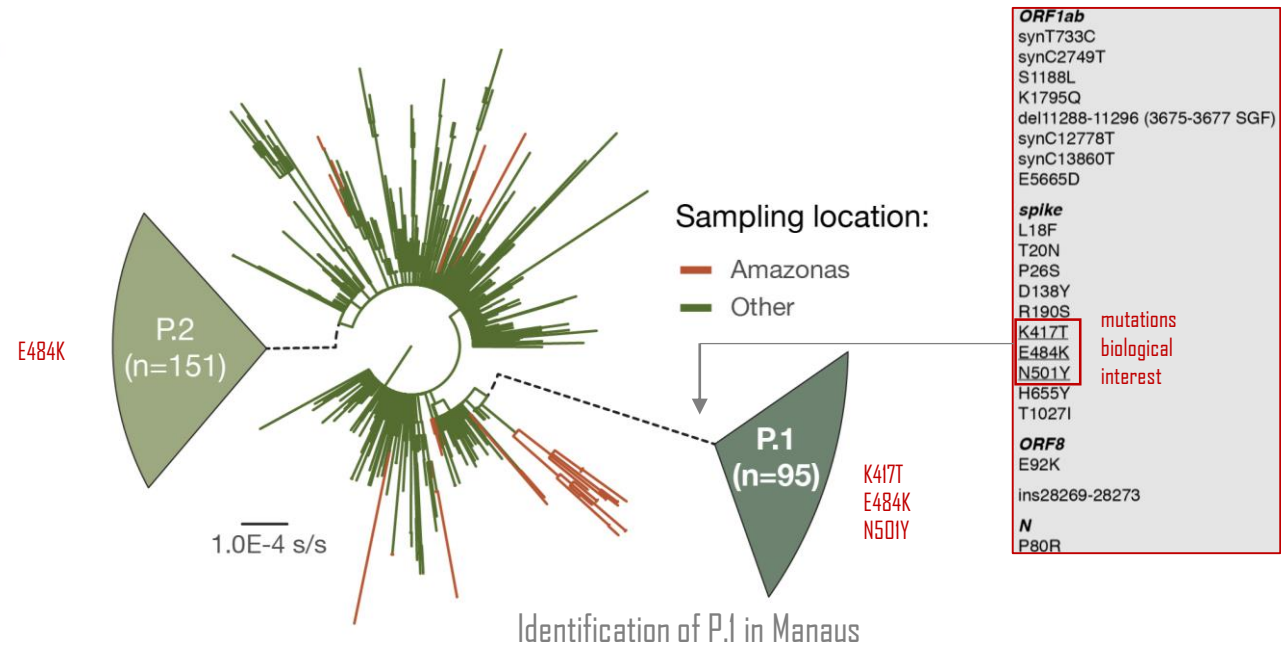

## Three-quarters attack rate of SARS-CoV-2 in the Brazilian Amazon during a largely unmitigated epidemic

SCIENCE • 8 Dec 2020 • Vol 371, Issue 6526 • pp. 288-292 • DOI:10.1126/science.abe9728

Our data show that >70% of the population had been infected in Manaus about 7 months after the virus first arrived in the city. This is above the theoretical herd immunity threshold. However, prior infection may not confer long-lasting immunity (30, 31). Indeed, we observed rapid antibody waning in Manaus, consistent with other reports that have shown signal waning on the Abbott IgG assay (14, 32). However, other commercial assays, with different designs or targeting different antigens, have more stable signal (14), and there is evidence for a robust neutralizing antibody response several months out from infection (33). Rare reports of reinfection have been confirmed (34), but the frequency of its occurrence remains an open question (35). Manaus represents a “sentinel” population, giving us a data-based indication of what may happen if SARS-CoV-2 is allowed to spread largely unmitigated. Further seroepidemiological, molecular, and genomic surveillance studies in the region are required urgently to determine the longevity of population immunity, the correlation with the observed antibody waning, and the diversity of circulating lineages.

# Altered epidemiological characteristics of the P.1/Gamma VOC in Manaus

Two-category mathematical model to investigate transmissibility, immune evasion and disease severity of P.1 lineage in Manaus:

- P.1 is 1.7–2.4 (50% BCI) more transmissible compared to non-P1 lineages in Manaus
- P.1 can evade 21-46% (50% BCI) of protective immunity elicited by previous infection with non-P1 lineages
- 1.2–1.9 (50% BCI) times more likely to result in mortality: strained healthcare systems?
- Validated by subsequent studies on reinfection, disease severity and transmissibility

# Reinfection by the SARS-CoV-2 Gamma variant in blood donors in Manaus, Brazil

Carlos A. Prete Jr<sup>1</sup>, Lewis F. Buss<sup>2</sup>, Renata Buccheri<sup>3</sup>, Claudia M. M. Abraham<sup>4</sup>, Tassila Salomon<sup>5</sup>, Myuki A. E. Crispim<sup>4</sup>, Marcio K. Oikawa<sup>6</sup>, Eduard Grebe<sup>3,7,8</sup>, Allyson G. da Costa<sup>4</sup>, Nelson A. Fraiji<sup>4</sup>, Maria do P. S. S. Carvalho<sup>4</sup>, Charles Whittaker<sup>9</sup>, Neal Alexander<sup>10</sup>, Nuno R. Faria<sup>2,9,11</sup>, Christopher Dye<sup>11</sup>, Vítor H. Nascimento<sup>1</sup>, Michael P. Busch<sup>3,7</sup> and Ester Cerdeira Sabino<sup>2\*</sup>

## Proportion of reinfection cases in 2021:

- V curve 13.6%, (95% CI [7.0%, 24.5%])
- +Probable 22.7% (95% CI [14.3%, 34.2%])
- +Possible 39.3% (95% CI [29.5%, 50.0%])

## Rates of reinfection in individuals positive in 2020

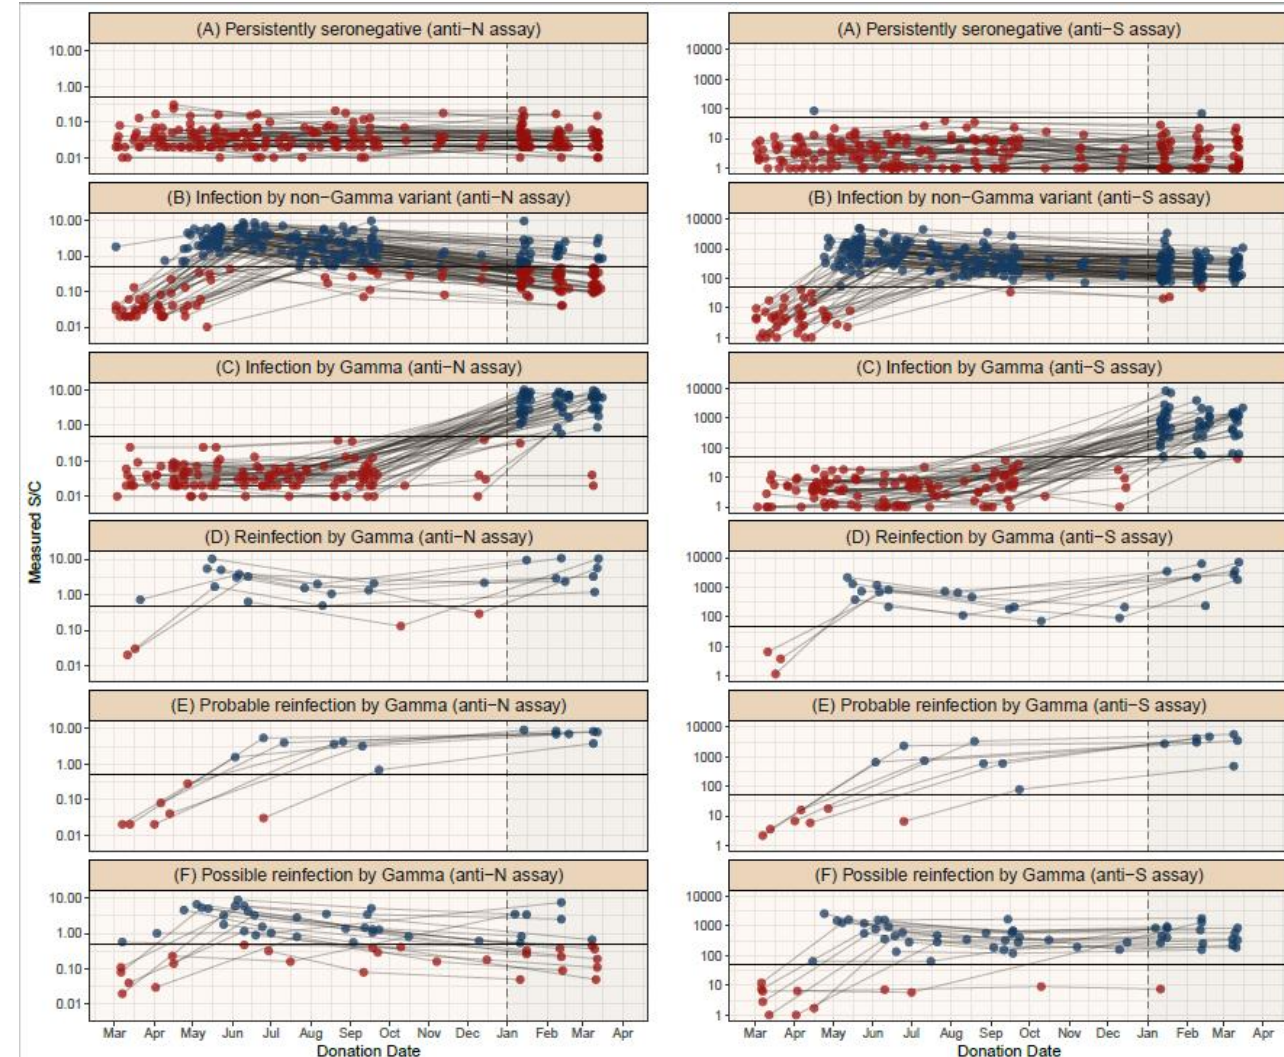

- V curve 6.5% (95% CI [3.3%, 12.3%])
- +Probably 12.2% (95% CI [7.5%, 19.1%])
- +Possible 26.8% (95% CI [19.8%, 35.3%])

## Rates of gamma infection in negative samples

- 115 negative in 2020: 51 infected in 2021 (44.3%, 95% CI [35.6%, 53.5%]).

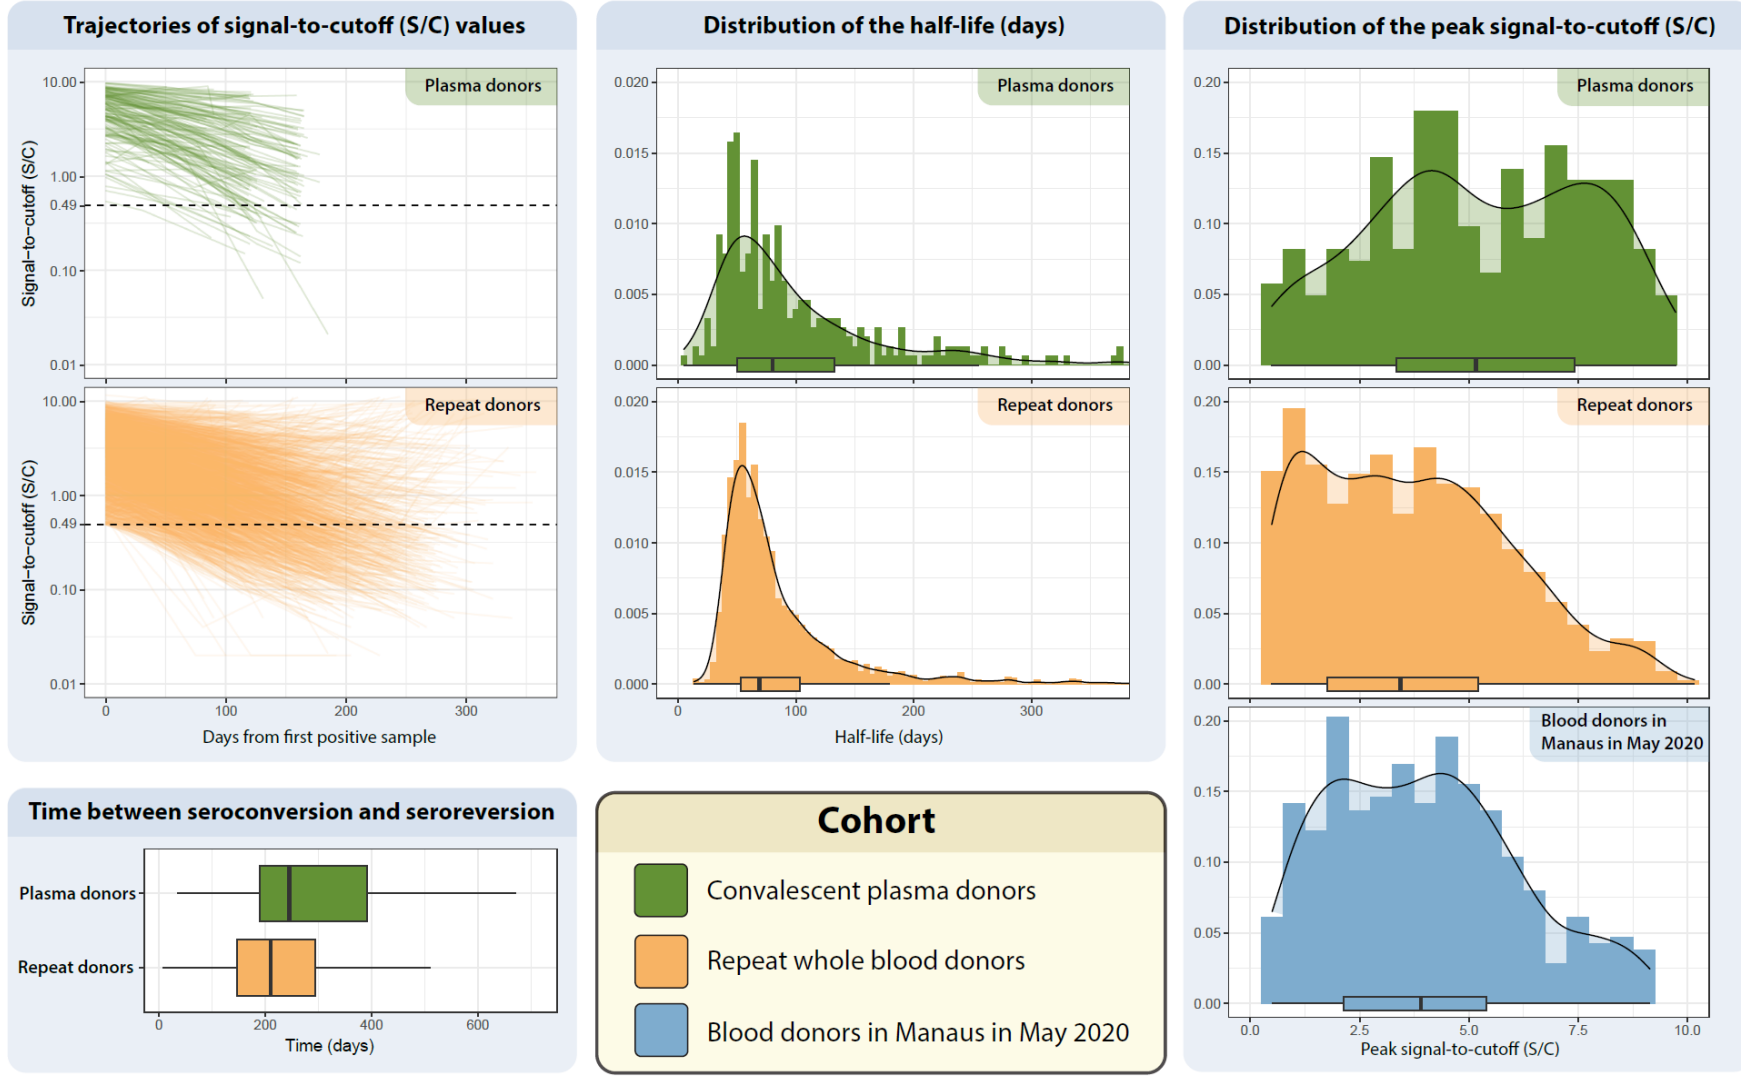

## The protection against reinfection conferred by previous infection

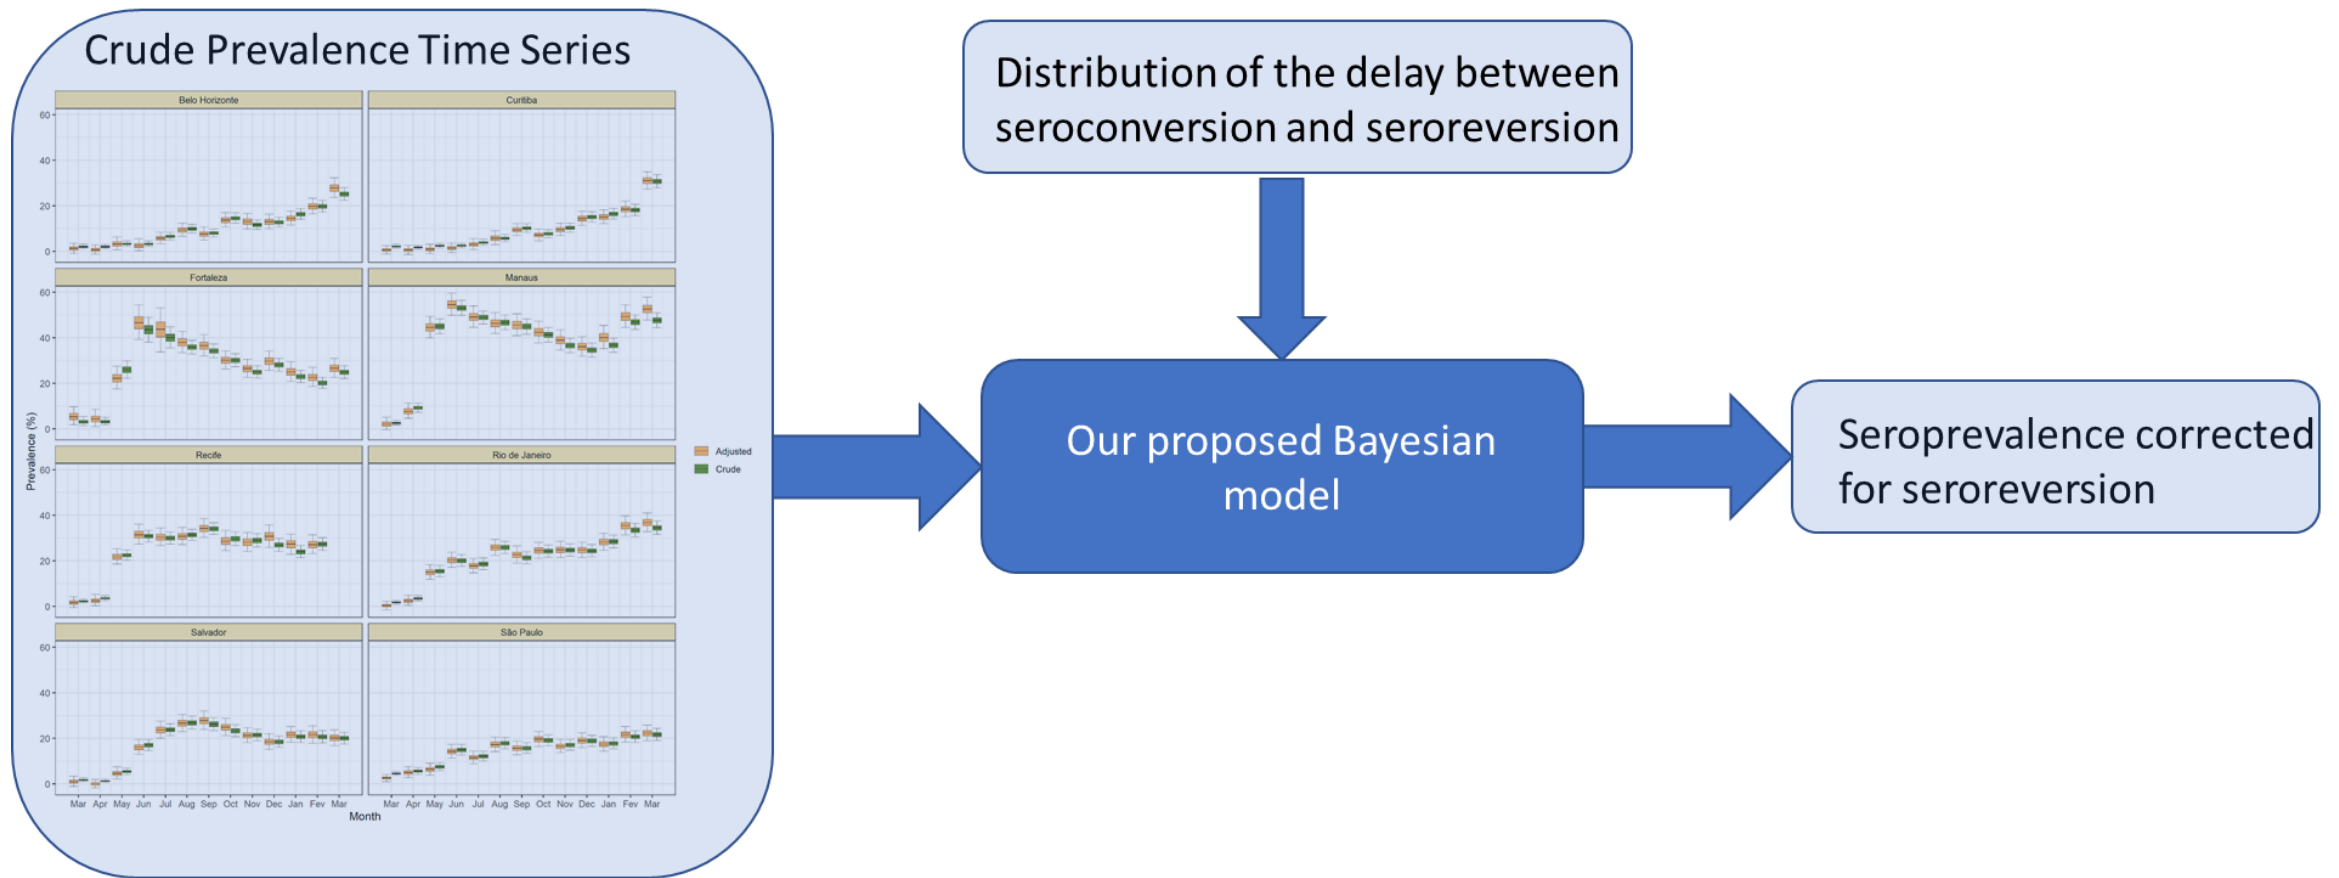

- V curve 85.3% (95% CI [71.3%, 92.7%]),
- + probably 72.5% (95% CI [54.7%, 83.6%])
- + possible 39.5% (95% CI [14.1%, 57.8%])

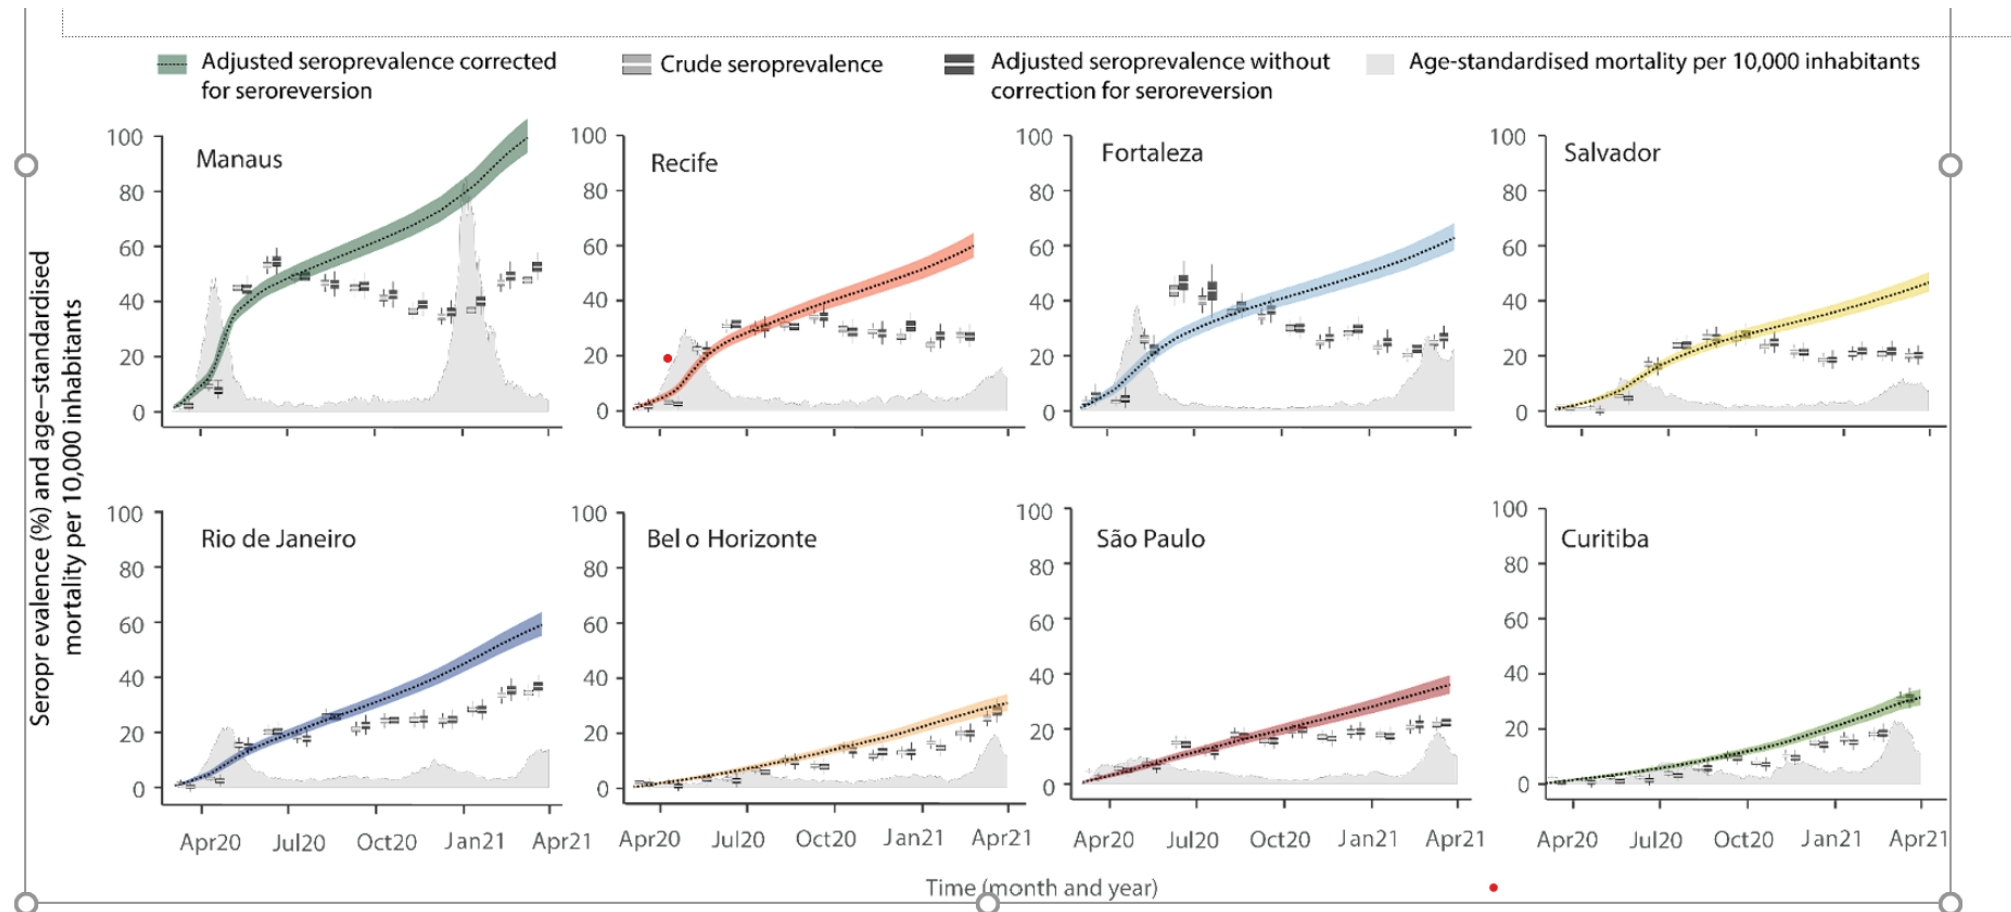

# Antibody waning and disease spectrum

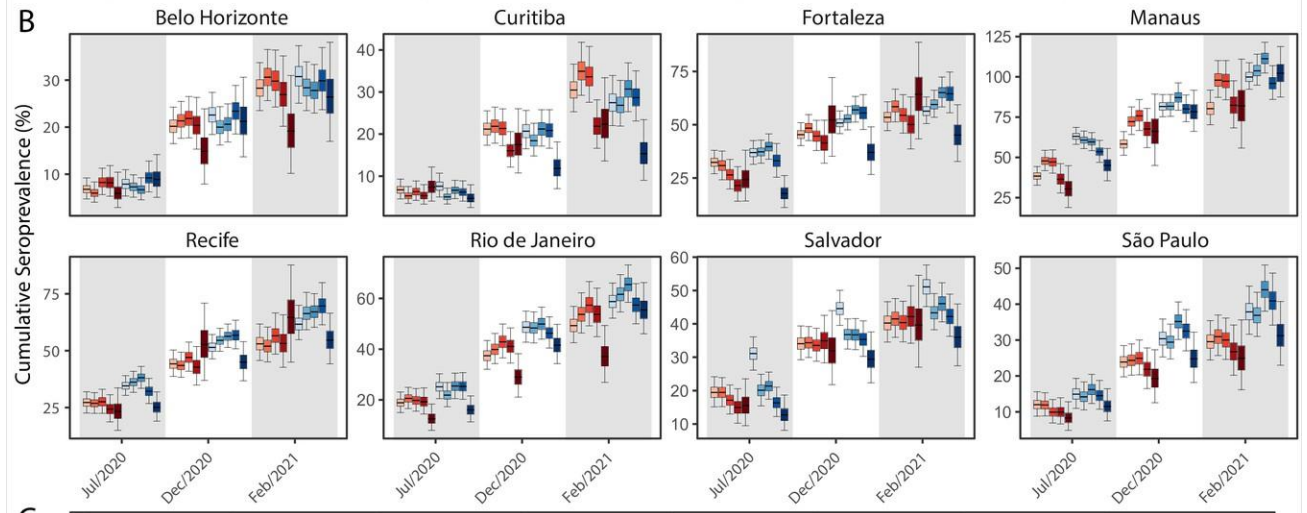

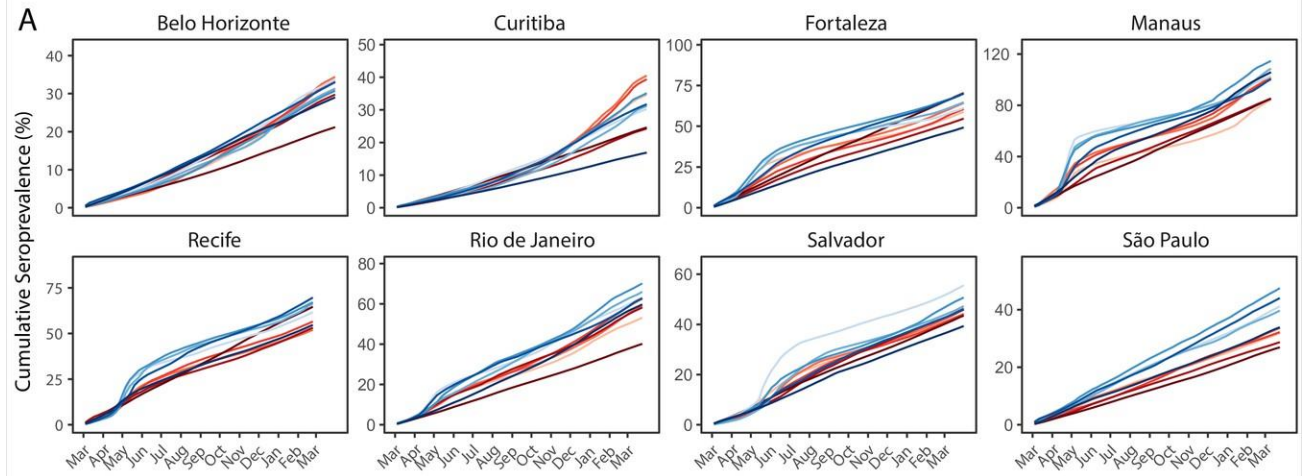

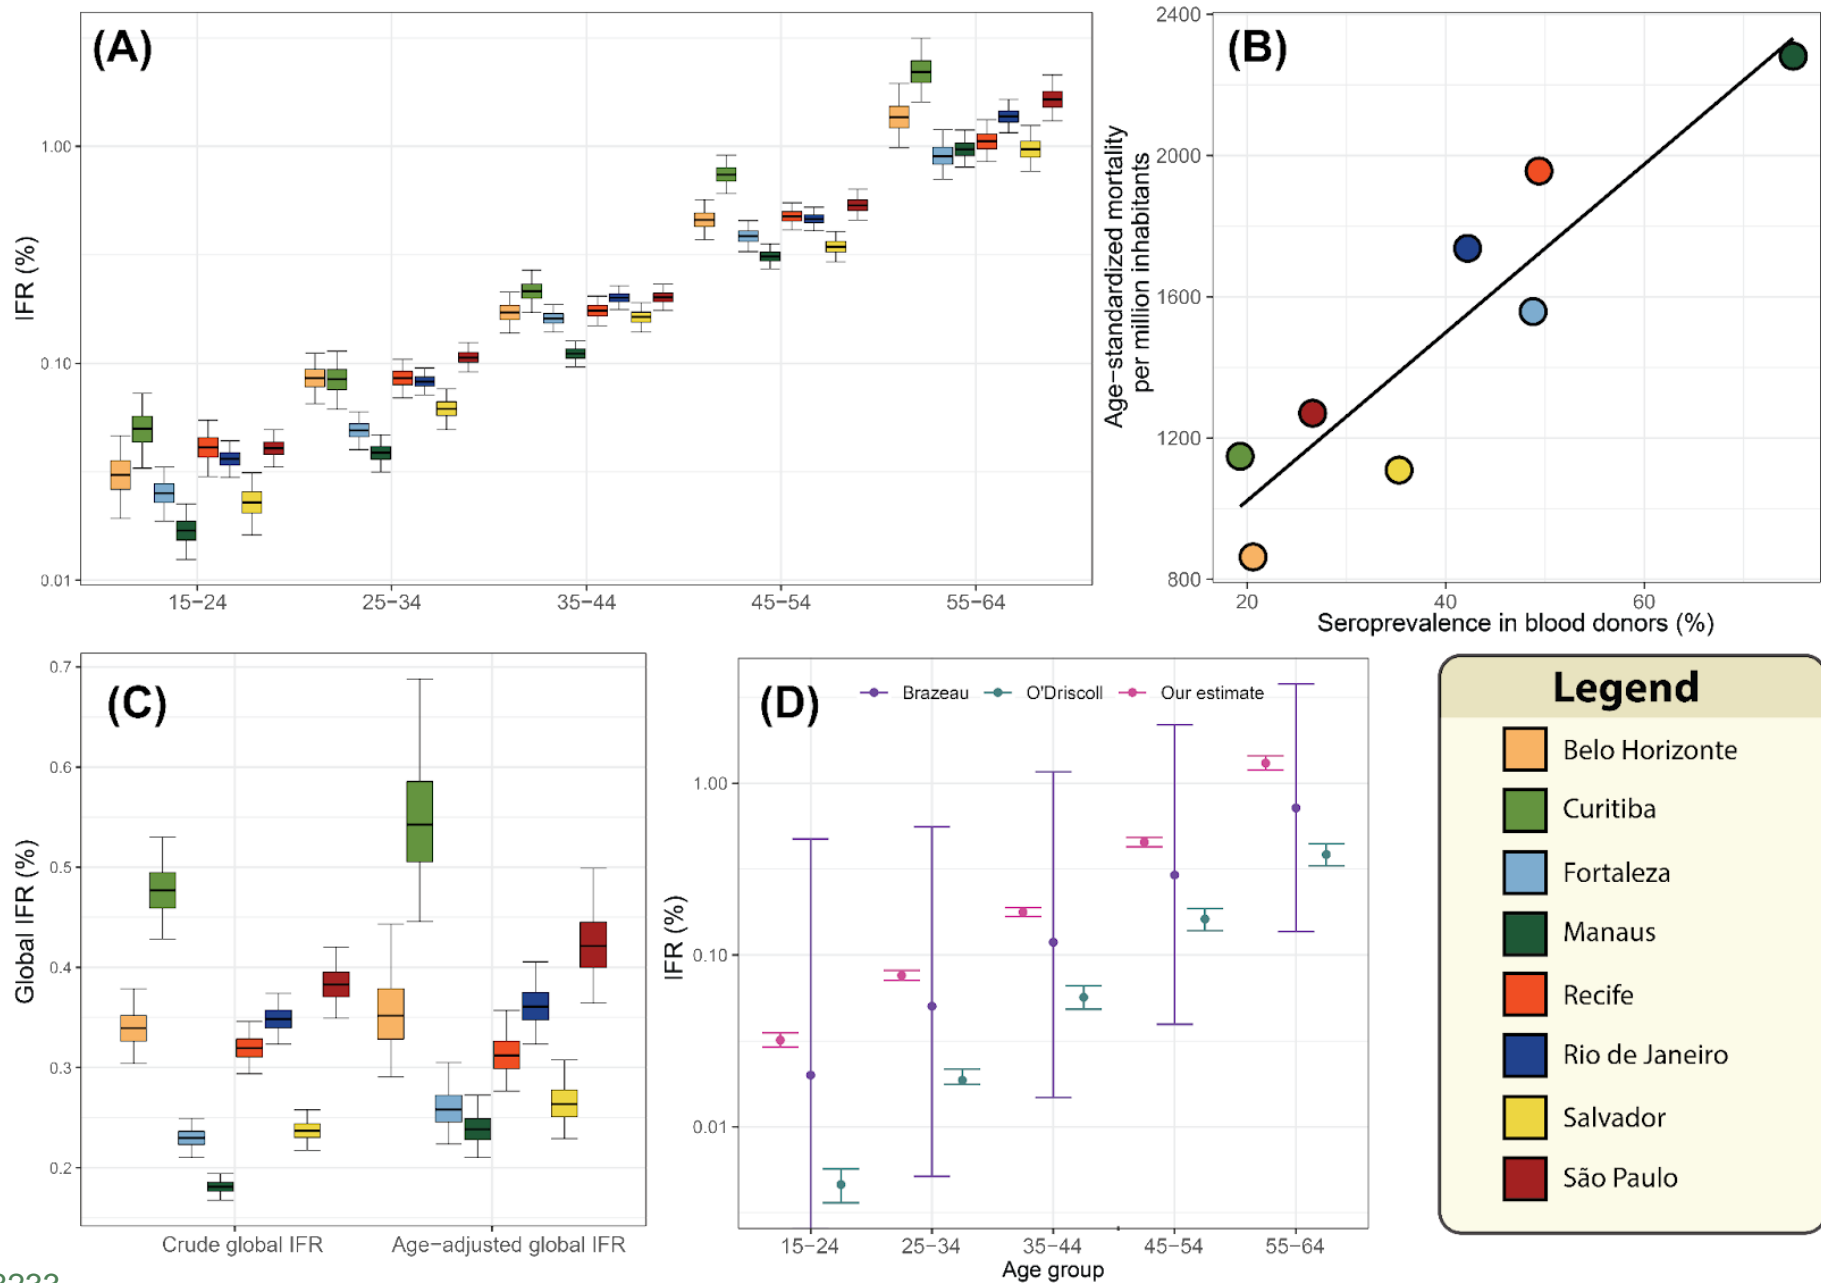

# Adjusted seroprevalence in eight Brazilian capitals

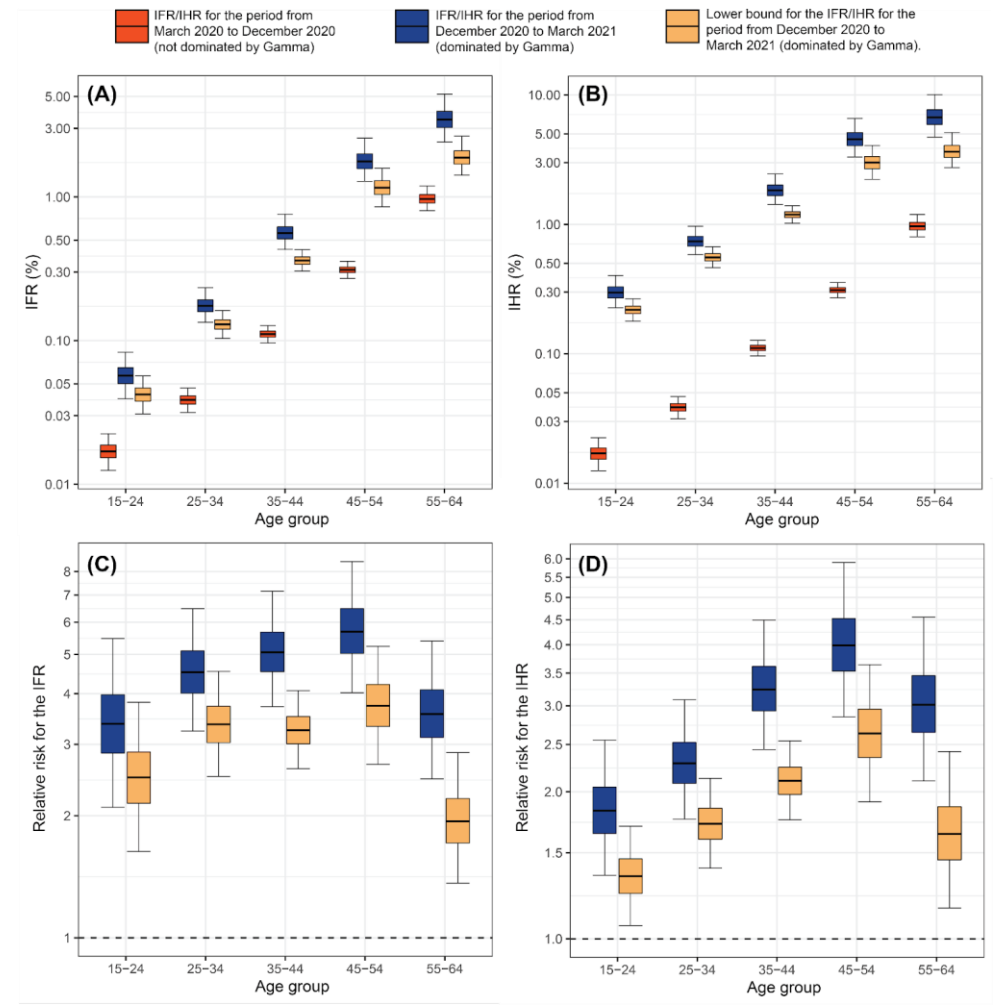

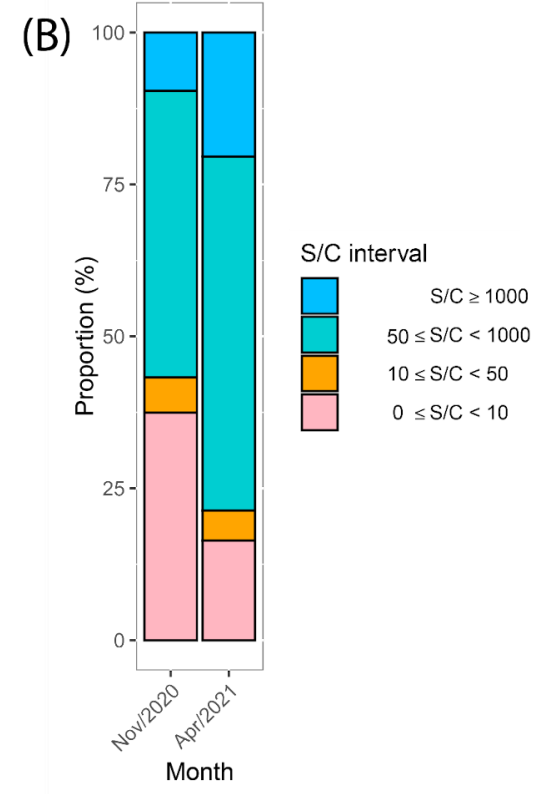

Female: 16–24 (F) 25–34 (F) 35–44 (F) 45–54 (F) 55–69 (F)  
 Male: 16–24 (M) 25–34 (M) 35–44 (M) 45–54 (M) 55–69 (M)

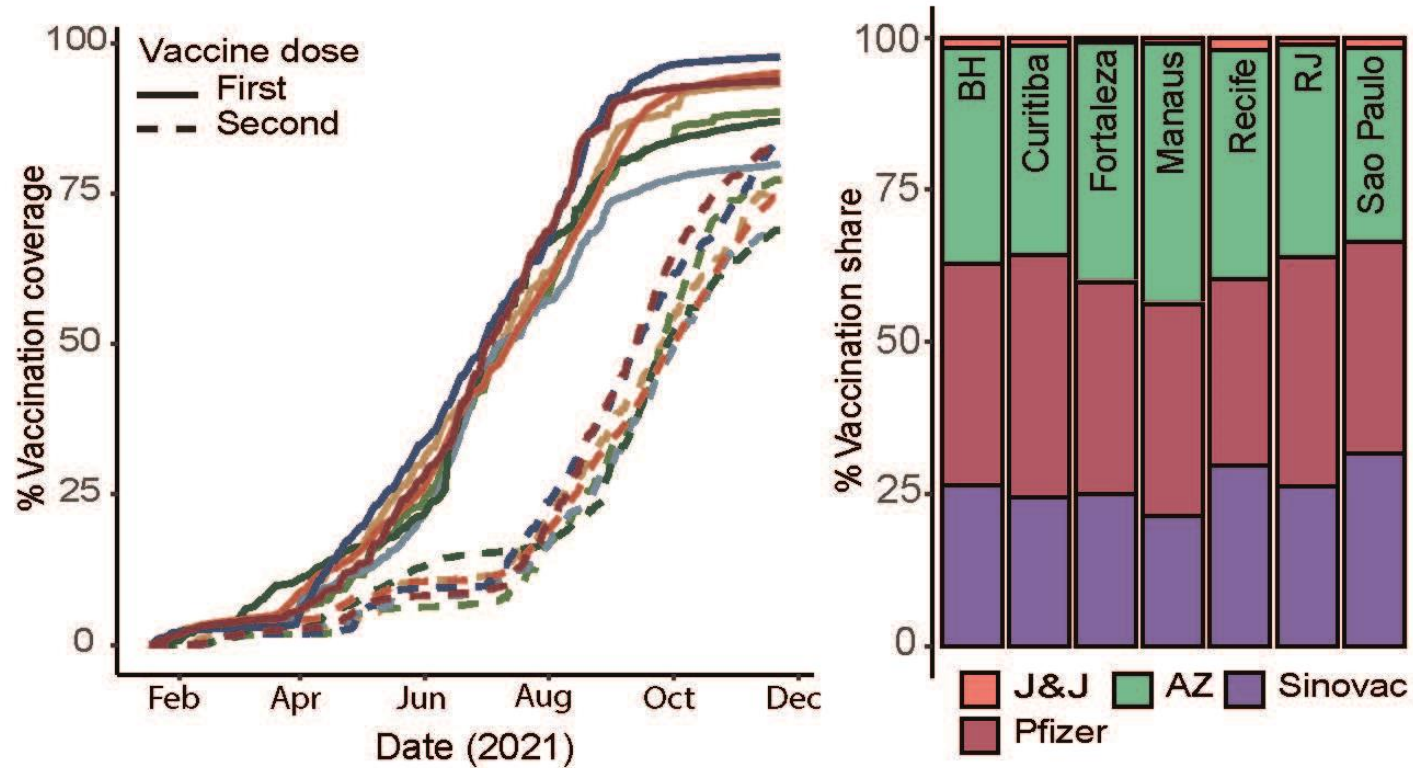

# IFR according to age and location

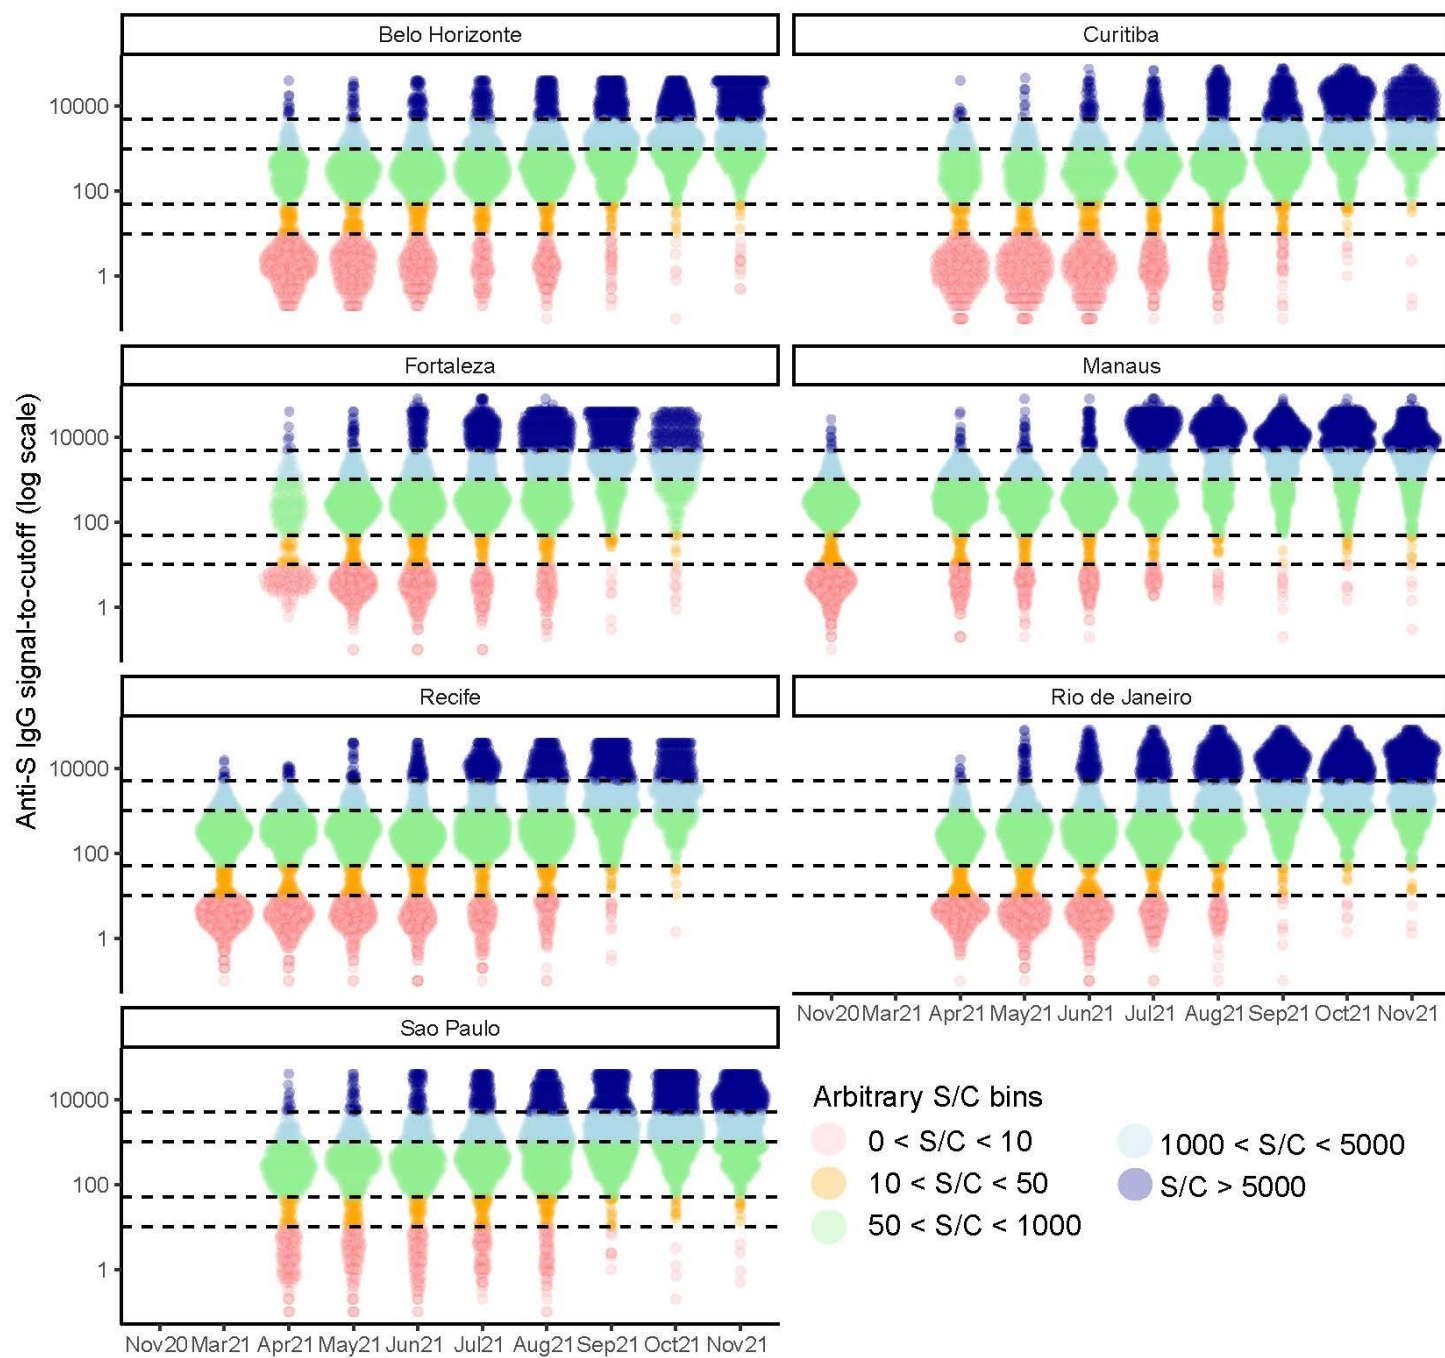

# 2<sup>nd</sup> wave had a lower attack rate and a higher morbidity/mortality

## Vaccination coverage in blood donor eligible age range

**Predicting SARS-CoV-2 variant spread in a completely seropositive population using semi-quantitative antibody measurements in blood donors**

# Conclusion

- Blood donors can provide important insights during an emergency.
- Studies are needed to compare rates of disease among donors and general population as a preparation for next crisis.
- Can serological data indicate population level of protection?
