

An Approach for Rapid Estimates of
[Fe/H], [C/Fe], and [Mg/Fe]
for S-PLUS Stars

TIMOTHY C. BEERS

UNIVERSITY OF NOTRE DAME, USA

With

Haibo Yuan, Young Sun Lee, Yang Huang

CURRENT STATUS

- Whitten et al. (2021) have established that use of a sophisticated neural network approach with S-PLUS filters is capable of obtaining estimates of stellar parameters (T_{eff} , $\log g$, $[\text{Fe}/\text{H}]$ and $[\text{C}/\text{Fe}]$) based on S-PLUS narrow- and medium-band filters
- Pros:
 - Appears to work extremely well, down to $[\text{Fe}/\text{H}] \sim -3.5$ to -4.0
 - Provides estimates that are robust to photometric errors in individual filters
- Cons:
 - Somewhat complex
 - Yet to be extended to other elements

WHITTEN ET AL. (2021)

Effective Temperature Network

Metallicity Networks

4250 - 5750 K

5500 - 7000 K

Absolute Carbon Abundance Networks

4250 - 5750 K

5500 - 7000 K

WHITTEN ET AL. (2021)

Distribution of residuals in T_{eff} , $[\text{Fe}/\text{H}]$, $[\text{C}/\text{Fe}]$
with respect to T_{eff}

AN ALTERNATIVE APPROACH

➤ Huang et al. (2021) have established that a combination of narrow- or medium-band filters from SkyMapper (e.g., v or u) with Gaia broad-band color ($G_{BP} - G_{RP}$) can provide accurate estimates of T_{eff} and $[\text{Fe}/\text{H}]$ based on polynomial fits

➤ Pros:

Precision of Gaia colors is extremely high

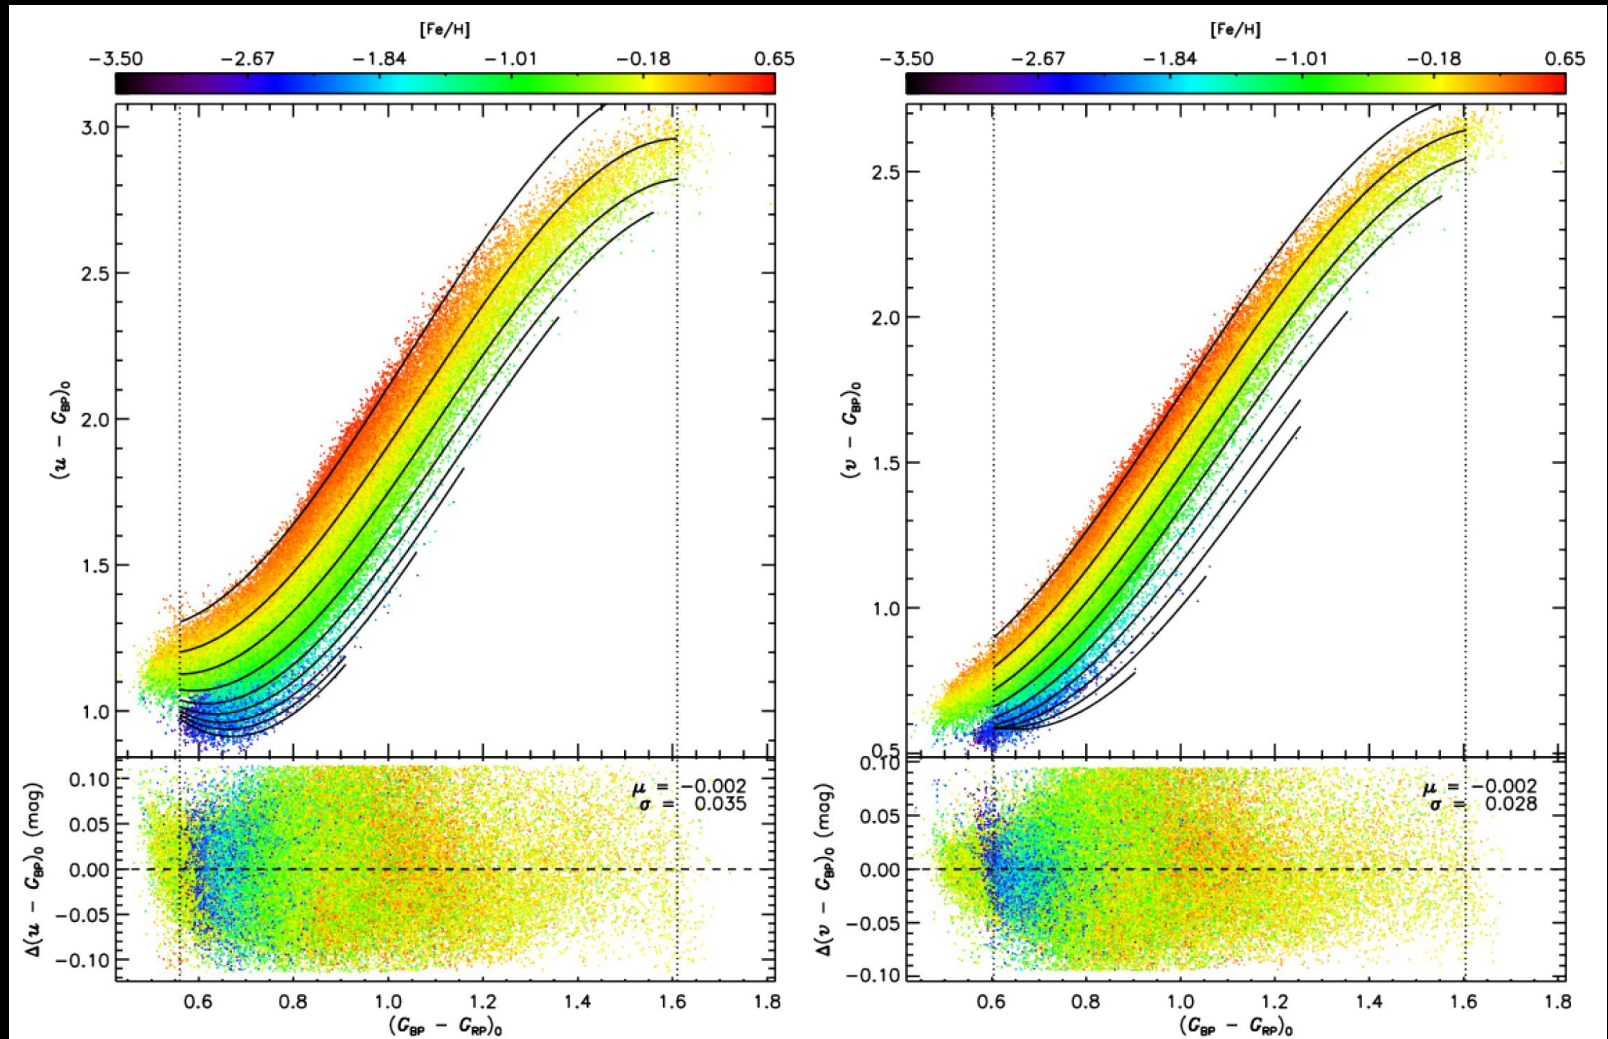

Appears to work extremely well, down to $[\text{Fe}/\text{H}] \sim -3.5$

Inherently simpler to apply, once filters are properly zero-pointed

➤ Cons:

Yet to be extended to other elements

HUANG ET AL. (2021)

Dwarfs

HUANG ET AL. (2021)

Giants

HUANG ET AL. (2021)

Distribution of residuals in $[\text{Fe}/\text{H}]_{\text{phot}}$ with respect to $[\text{Fe}/\text{H}]_{\text{spec}}$ for medium- and high-resolution determinations

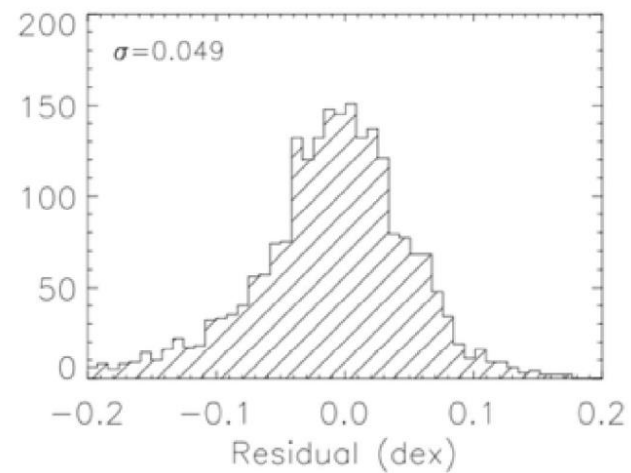

A PROPOSAL

- Extend the Huang et al. techniques to S-PLUS for determinations of T_{eff} , $[\text{Fe}/\text{H}]$, $[\text{C}/\text{Fe}]$, $[\text{Mg}/\text{Fe}]$
- These are the most important elements for tracing the nature of the underlying stellar populations, and can be used in constructing “population blueprints” as in the An & Beers series of papers.
- Can be obtained quickly, essentially as soon as S-PLUS data are taken and reduced, for quick estimates of these parameters that can also be used to identify stars of greatest interest for high-resolution follow-up

HAIBO YUAN ET AL. (IN PREP.)

HAIBO YUAN ET AL. (IN PREP.)

WHY DOES THIS WORK ?

- Determination of $[Fe/H]$ based on S-PLUS narrow-band filter around the CaII H & K lines is relatively insensitive to surface gravity ($\log g$)
- Do not have to DETERMINE $\log g$ for each star, just make the relatively trivial split into dwarf and giant classification based on Gaia CMD and $[Fe/H]$
- The elemental abundances $[C/Fe]$ and $[Mg/Fe]$ ARE sensitive to gravity, BUT they are **monotonic** individually with color (in different ways) for dwarfs and giants

NEXT STEPS

- Extend the Huang et al. techniques to S-PLUS for determinations of T_{eff} , $[\text{Fe}/\text{H}]$, $[\text{C}/\text{Fe}]$, $[\text{Mg}/\text{Fe}]$ to lower $[\text{Fe}/\text{H}]$ using spectroscopic params from LAMOST / SDSS obtained with the SSPP
- Currently finishing up final inspection of some 50K / 60K stars from LAMOST and SDSS with $-4.5 < [\text{Fe}/\text{H}] < -1.8$
- Use as test cases to compare with possibly improved determinations from, e.g., Whitten et al. (2021) approach for these elements
- Apply to S-PLUS !

SMSS SHALLOW SURVEY (DR2)

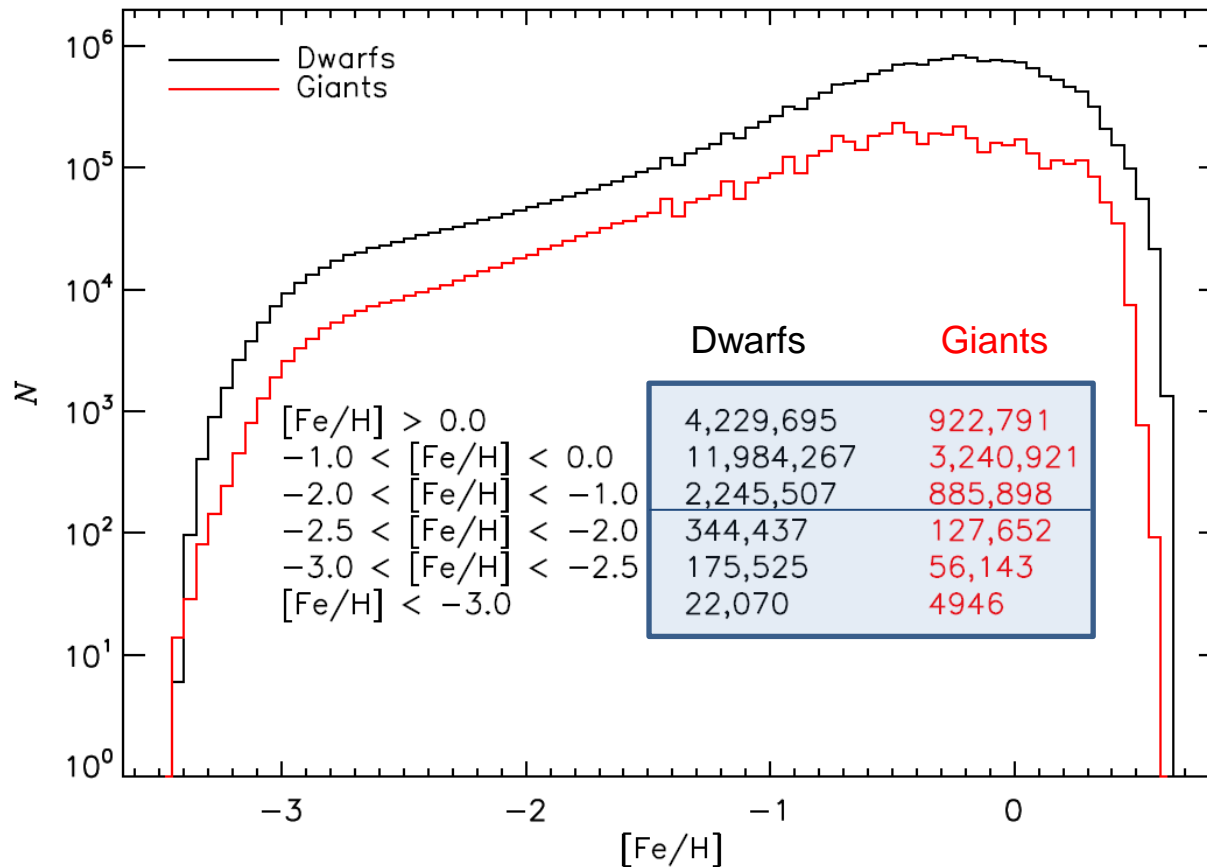

Figure 1. Coverage of SkyMapper DR2, colour-coded to indicate the progress on different fields: (*black*) complete Main Survey coverage in all six filters; (*red*) at least one Main Survey image in all six filters; (*orange*) Main Survey images in *iz* filters; (*yellow*) Shallow Survey images in all six filters; (*grey*) any images. Main Survey images have exposure times of 100 s in each filter, while the Shallow Survey exposures in *u, v, g, r, i, z* are 40, 20, 5, 5, 10, 20 s.
