PCA Tomography

AIStar's Spectral Fitting

PCA Tomography

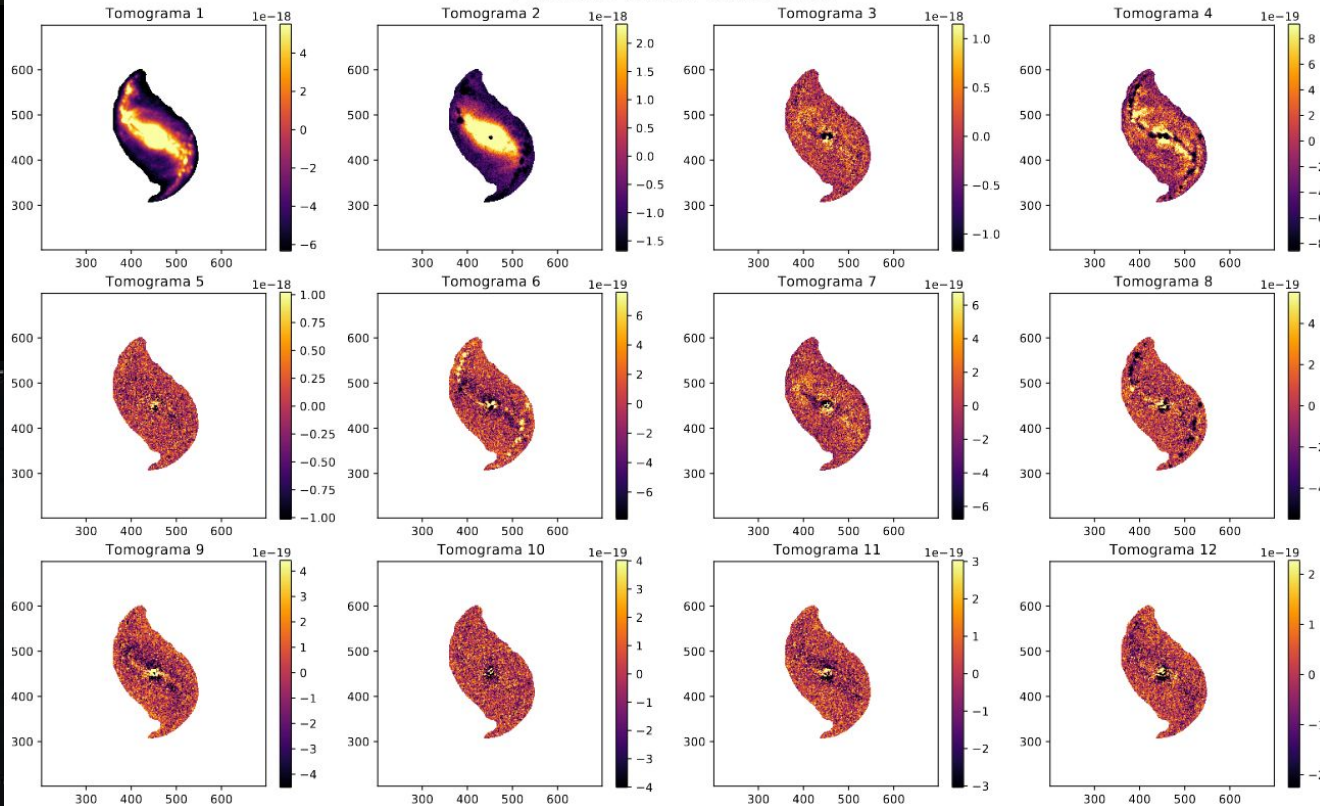

PCA (Principal Components Analysis) changes the coordinates of the system by the variance (decreasing)

$$\text{Flux}(\lambda) = \langle \text{Flux} \rangle + \text{PC}_1 \times E_1(\lambda) + \text{PC}_2 \times E_2(\lambda) + \text{PC}_3 \times E_3(\lambda) + \dots$$

(Tomogram) (Eigenspectrum)

PCA Tomography

Eigenspectra
(spectra)

$$PC_3 \times E_3(\lambda) + \dots$$

PCA configurations

➤ changing variance → different results of PCA

- PCA of data cube
- PCA scaled by the mean spectrum
- PCA normalized each pixel by its mean flux
- PCA normalized by the filter r
- PCA of log of the cube

$$\mathbf{F}(\lambda, y, x)$$

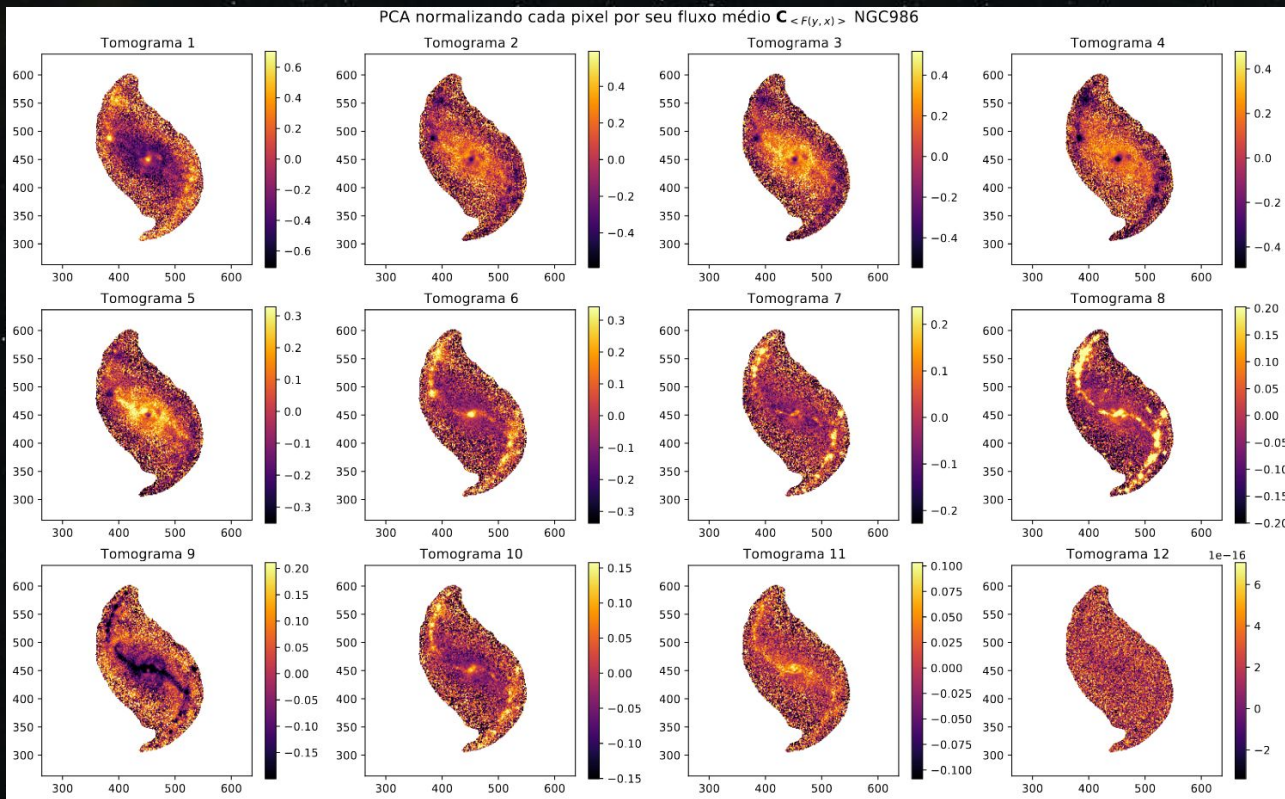

$$\frac{\mathbf{F}(\lambda, y, x)}{\langle \mathbf{F}(\lambda) \rangle}$$

$$\frac{\mathbf{F}(\lambda, y, x)}{\langle \mathbf{F}(y, x) \rangle}$$

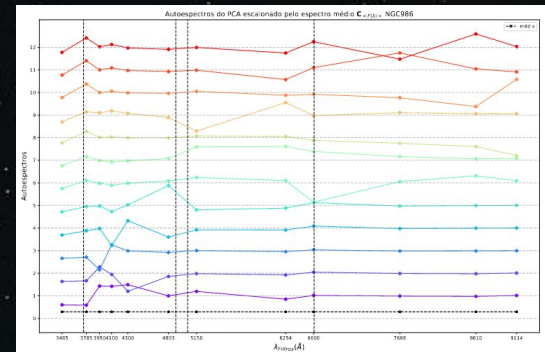

$$\frac{\mathbf{F}(\lambda, y, x)}{\overline{\mathbf{F}(\lambda_r, y, x)}}$$

$$\log[\mathbf{F}(\lambda, y, x)]$$

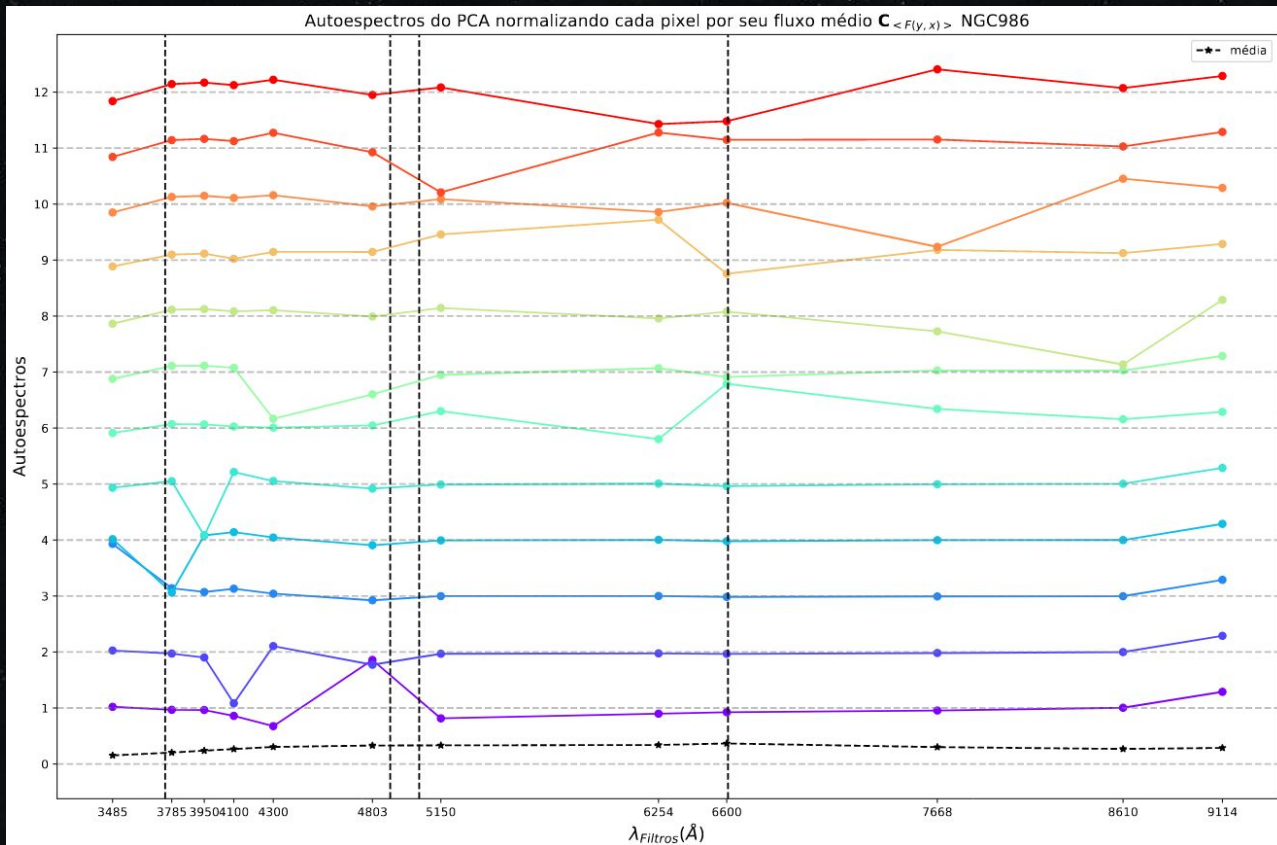

PCA normalized each pixel by its mean flux NGC 986

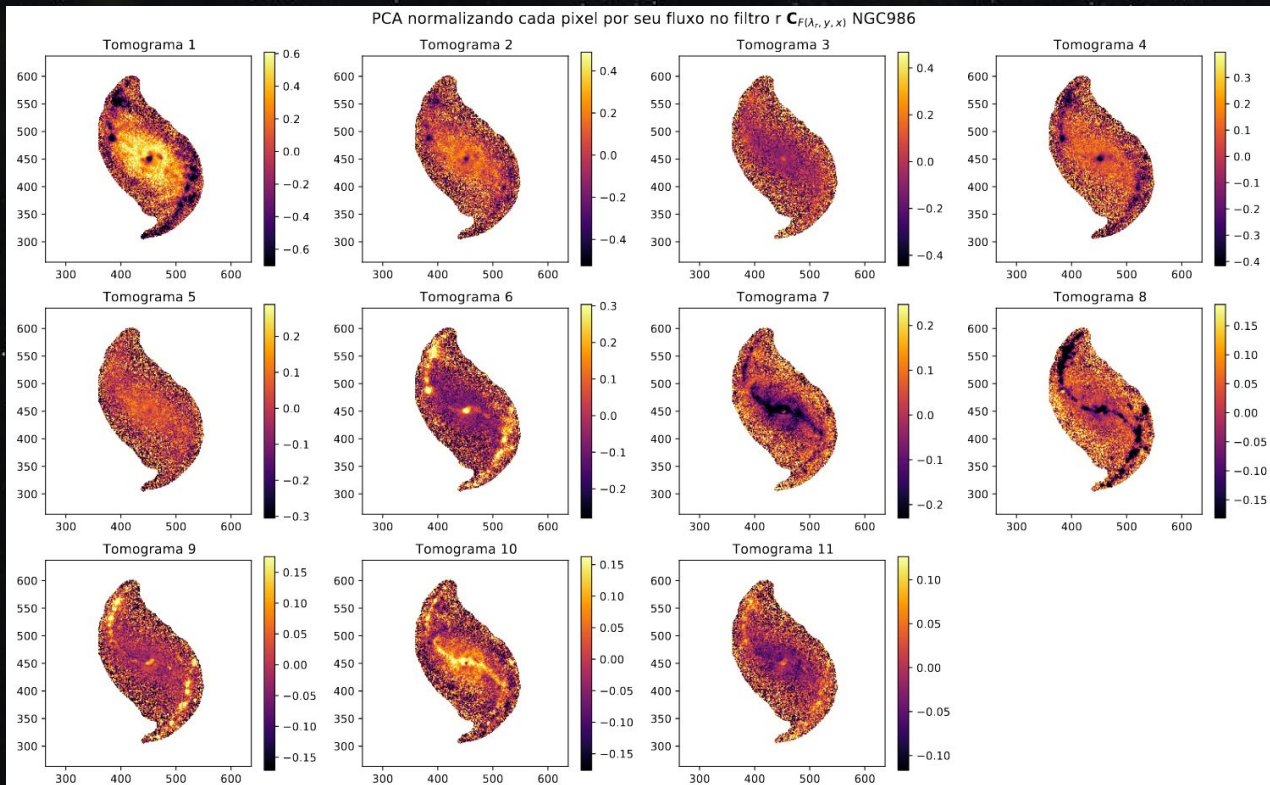

Eigenspectra

Conclusion

- Improve pre-processing, especially in regions with low surface brightness
- PCA: Tomograms indicate good potential, but the interpretation of the eigenspectra needs further work
- AIStar: We got great spectral fits, maps and consistent radial profiles for various properties
- Promising study to be applied to other S-PLUS galaxies
